High Density  
**laser** wakefield acceleration

# Exploration of LWFA dependences on $a_0$ , $n_e$

- Some exploratory attempts in raw theory
- Needs to check by asking the mother nature (or some PIC simulation) → a good test in this Term Project?

# High Density LWFA

Trapping width and the phase velocity of plasma wave:  $v_{tr} \sim \sqrt{E}$ ,  $v_{ph}$

## Recall Homework 2

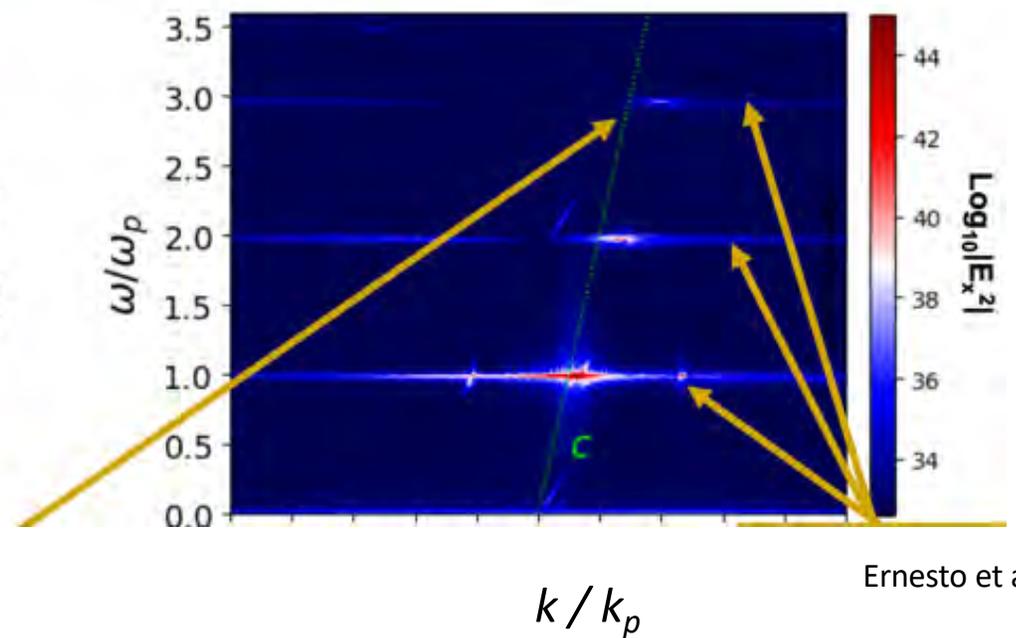

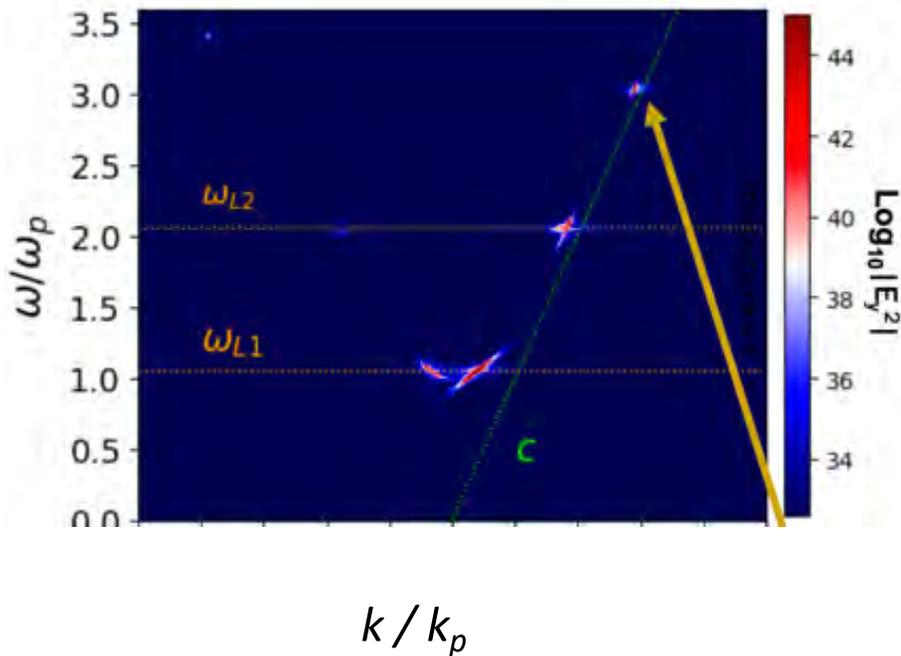

A.

Argue why higher the (longitudinal) plasma wave phase velocity  $v_{ph}$  is, it is more robust. Show which plasma electrons are trapped [ref. T. O'Neil, Phys. Plasma **8**, 2255 (1965)] by such a wave whose trapping width is  $v_{tr}$ . Then, derive the Tajima-Dawson field  $E_{TD} = m \omega_p c / e$  when you set  $v_{tr}$  is the ultimate phase velocity of  $v_{ph} = c$ .

B.

Show that if you set the wakefield phase velocity lower than the speed of light  $c$ , say at  $v_{ph}$ , then we obtain the saturation field  $E_{ph}$  of wakefield as  $E_{ph} = E_{TD} (v_{ph} / c)$ .

# Photon group velocity vs. plasmon phase velocity

Ernesto et al

$$v_{gr} = d\omega / dk$$

$$\rightarrow v_{ph} = \omega / k = v_{gr} \quad (\text{laser driven wakefield})$$

$$= v_{tr} \quad (\text{wakefield saturation condition})$$

# HW#2 B

$$v_{ph} = v_{tr} = \sqrt{\frac{eE}{mk}}$$

$$\frac{eE_{ph}}{mk} = v_{ph}^2$$

$$k = \frac{\omega_p}{v_{ph}}$$

$$\rightarrow E_{ph} = \frac{m v_{ph} \omega_p}{e} = \left(\frac{m c \omega_p}{e}\right) \left(\frac{v_{ph}}{c}\right)$$

When  $v_{ph} \rightarrow v_{th}$

$$v_{th} = \lambda_D \omega_p$$

$$E_{th(ph)} = \frac{m \omega_p}{e v_{th}} v_{th}^2 = 4\pi n e \lambda_D$$

[TT 11/23/21]

$$F_w = eE_w = m v_{ph} \omega_p a_0^2$$

$$L \sim \frac{\pi c}{\omega_p} \frac{n_{cr}}{n_e} v_{ph}$$

$$\Delta \mathcal{E} \sim m \left(\frac{v_{ph}}{c}\right) a_0^2 \frac{n_{cr}}{n_e} \rightarrow m c^2 a_0^2 \left(\frac{\Delta n_e}{n_e}\right)$$

$$v_{ph} \sim c \sqrt{1 - \frac{n_e}{n_{cr}}} \sim c \sqrt{\frac{\Delta n_e}{n_{cr}}}$$

$$= m c^2 a_0^2 \left(\frac{\Delta n_e}{n_e}\right)$$

(when  $n_e \rightarrow n_{cr}$ )

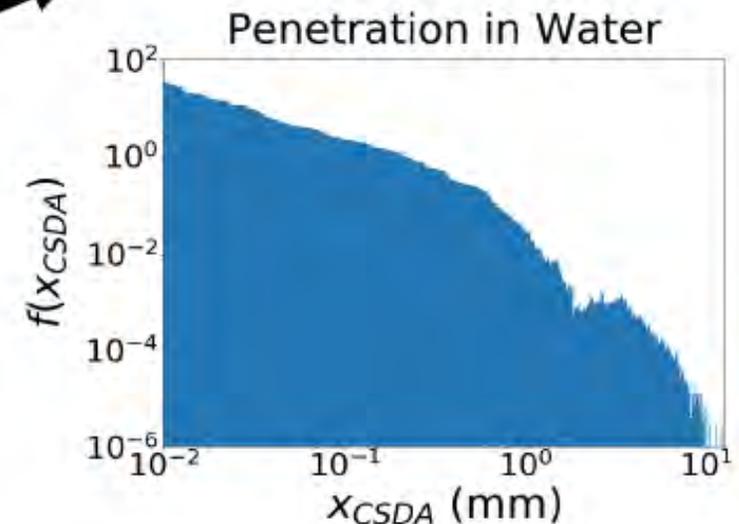

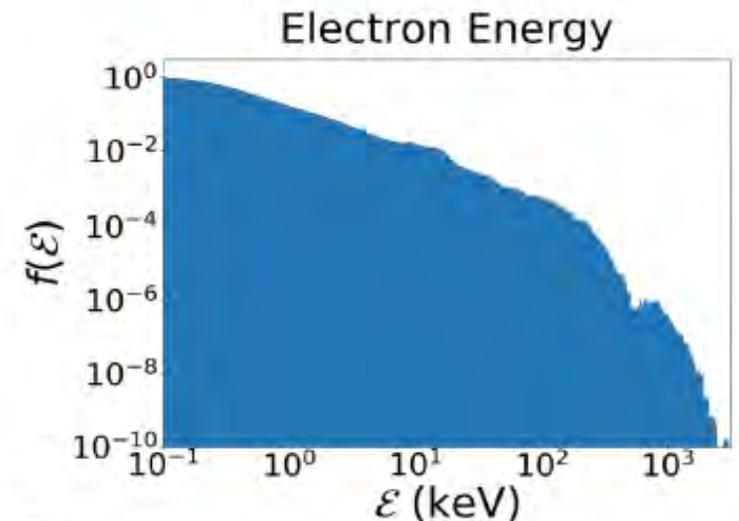

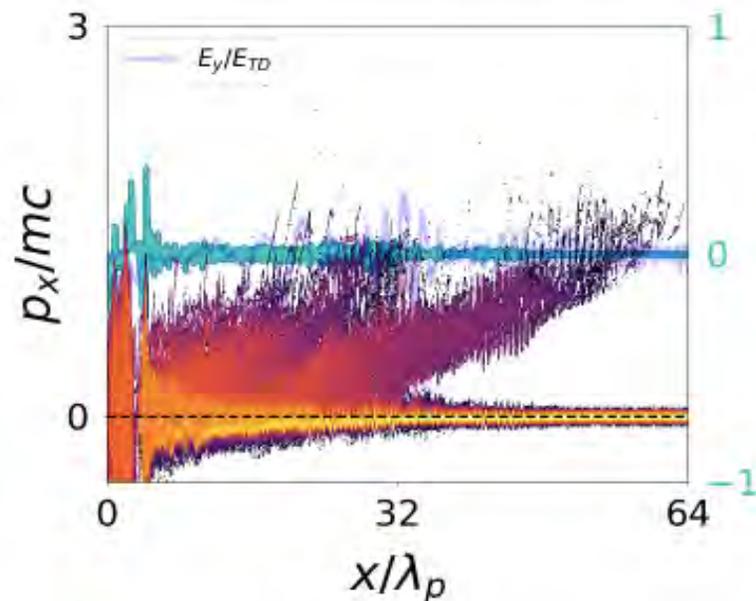

$$m c^2 a_0^2 \left(\frac{n_{cr}}{n_e}\right)$$

(when  $n_e \ll n_{cr}$ )

# 5. Accelerator and X-ray sources in your stomach?

## Electron Tissue Penetration

- Critical plasma + long laser pulse ( $\lambda_l = 8\lambda_p$ )
- Electron energy spectrum  $\rightarrow$  tissue penetration
- Continuous slowing-down approximation (CSDA)
- Penetration  $\rightarrow$  tuned by  $n_c/n_e, a_0$

S. Nicks et al. (2019)

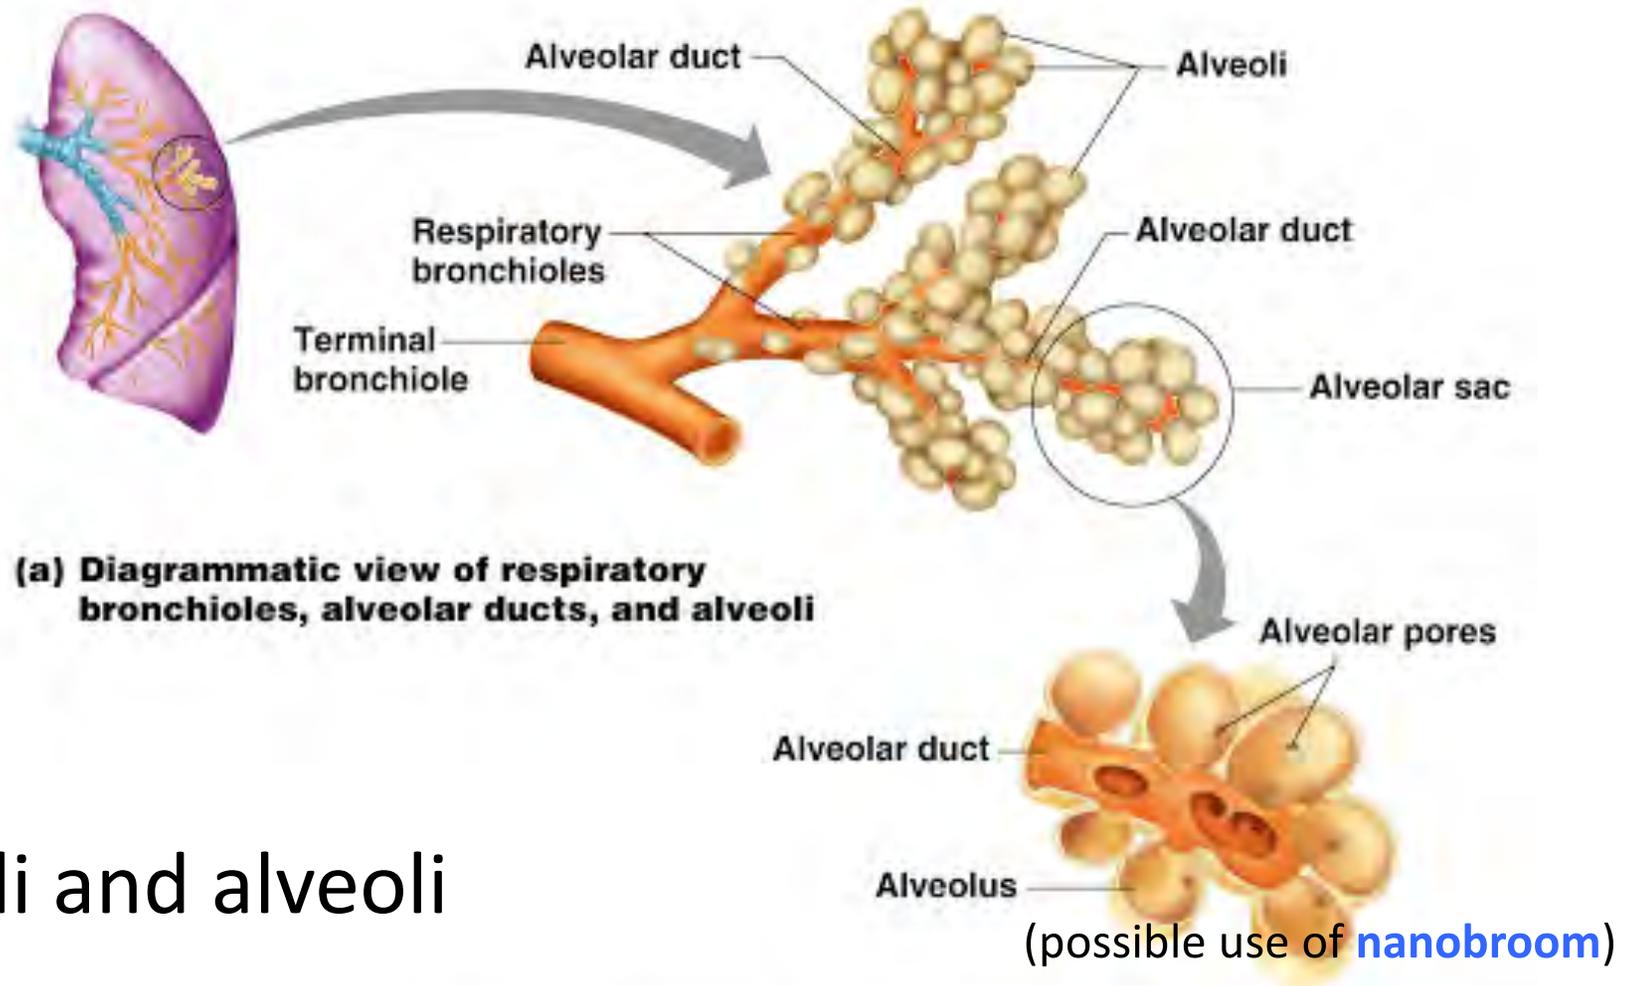

# 6. Nano vector medicine

Nanometric vector medicine: See Matsumoto et al. Sci. Rpt. (2019)

High-Z nanoparticles can stop electrons right there

(to target Cancer cells)

Now also → inhale (or conduct via the capillary effect) gold nanoparticles toward alveoli.

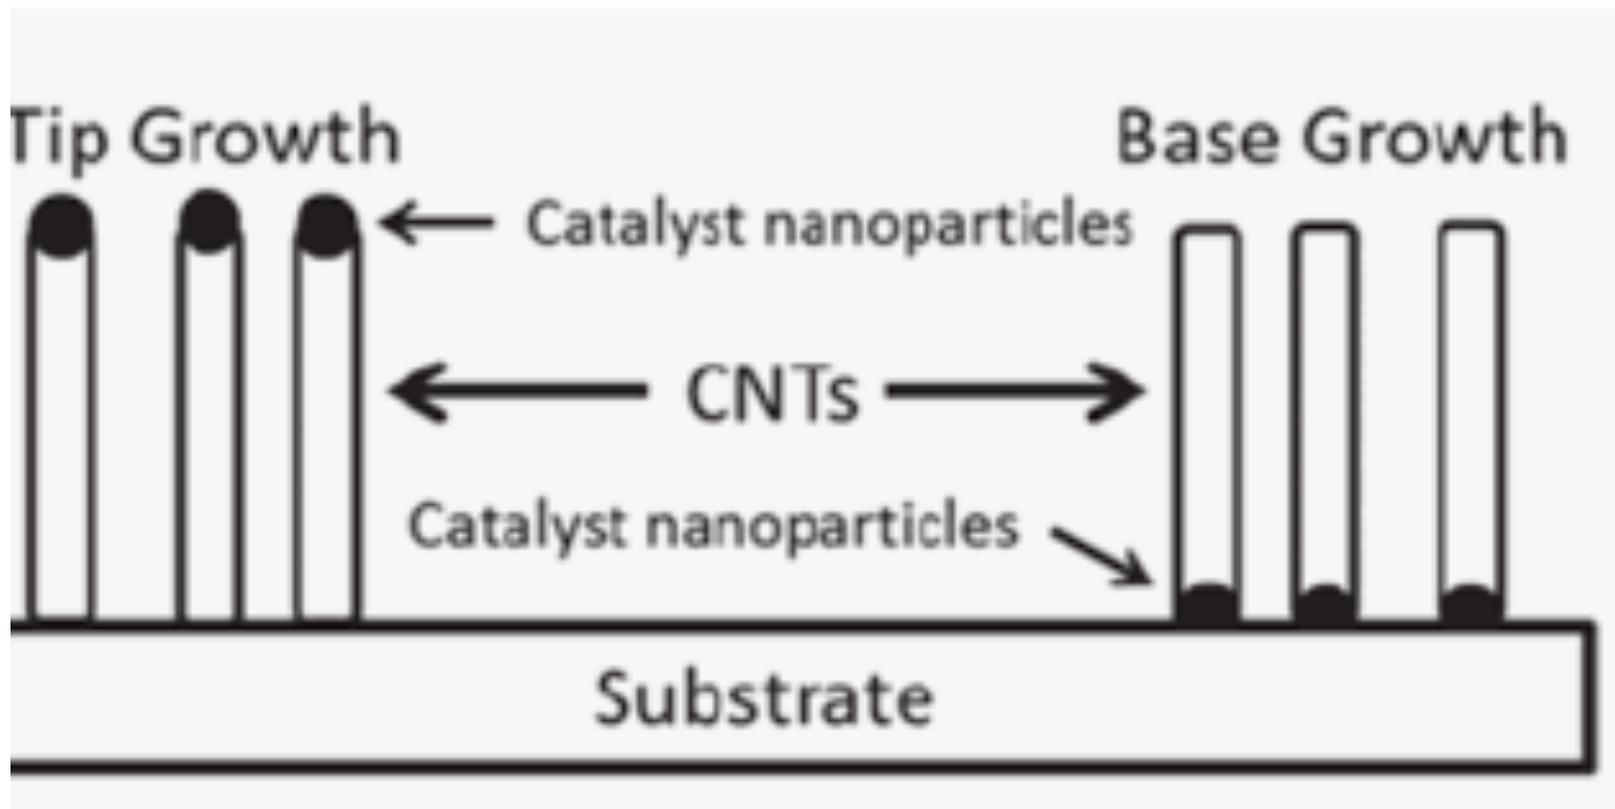

Bronchioli and alveoli

# Compact **laser-driven electron** accelerator **Nanotubes** organized with the substrate (2019)

CNT: large conductivity along the CNT tube axis, while insulating perpendicular

← **Laser** propagation

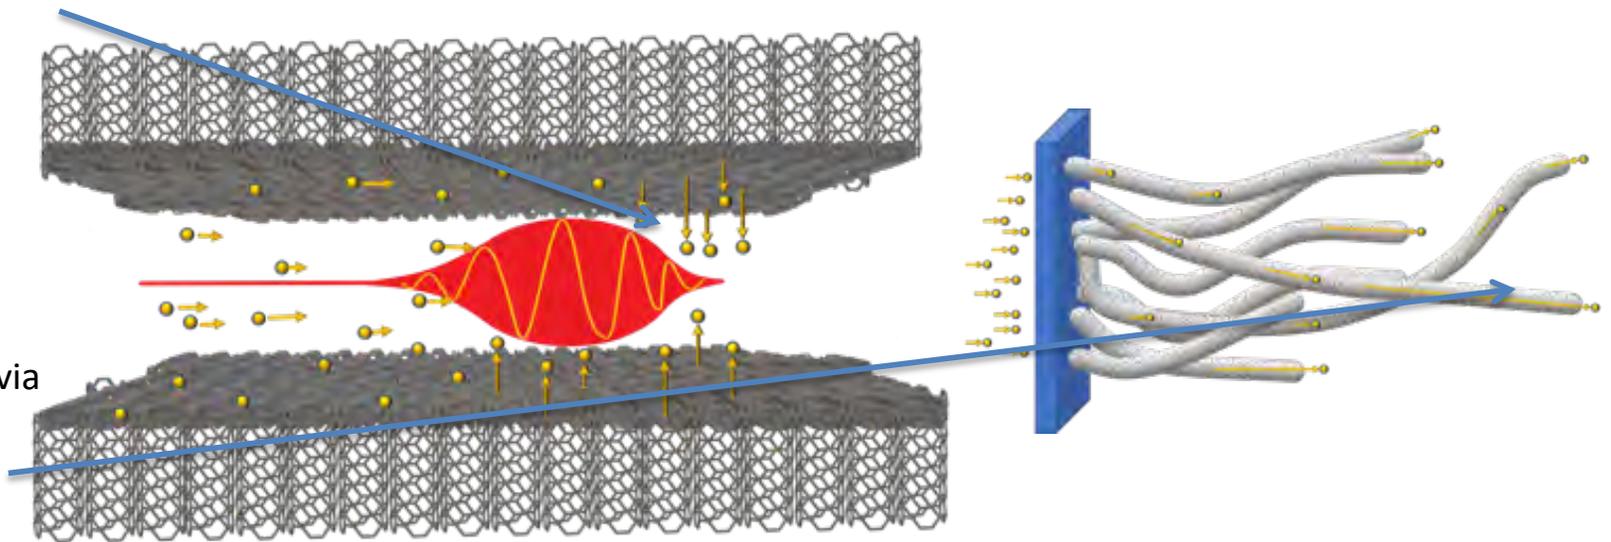

# Microaccelerator and Nanobroom at the tip of LWFA (a future possibility)

“bamboo forest” of nanotubes

“Nanobroom”

Electrons locally into the bronchus (till where the laser fiber reaches)

Through bronchioles (via self-focusing through “boom” nanotubes) and reach alveoli

bronchi ← → bronchioli alveoli

# Simple cases for small $a_0$ ( $< 1$ ) dependence

11/10/21

$$a_0 < 1$$
$$L_d \sim \frac{\lambda_p^3}{\lambda^2} \cancel{a_0^0}$$
$$E \sim E_0 a_0^2$$
$$\mathcal{E} \sim e E_0 a_0^2 \frac{\lambda_p^3}{\lambda^2} (a_0^0)$$
$$= a_0^2 E_0 \frac{\lambda_p^3}{\lambda^2}$$

# Some scaling exploration in $a_0 > 1$

Esarey et al, 10/23/21  
(2009)

$L_d \sim \frac{\lambda_p^3}{\lambda^2}$   $\sqrt{2} a_0$   $(a_0 > 1)$

$L_p$   $\left[ \lambda_p \text{ at the laser front} \right]$

$E \sim E_0 a_0$   $a_0 \gg 1$

$\Sigma \sim e E_0 a_0 \frac{\lambda_p^3}{\lambda^2}$   $\lambda_p = \frac{c}{\omega_p}$

$\sim a_0 \frac{cm \omega_p}{\omega^3} \frac{\omega^3}{c^2} a_0$   $\lambda = \frac{c}{\omega}$

dephasing length

$\sim a_0^2 m c^2 \left( \frac{\omega^2}{\omega_p^2} \right) 2\pi$

$\sim 2 m c^2 \frac{\pi (\omega/\omega_p)^2 a_0^2}{\omega_p^2}$

# Some consideration on the pulse length

TT 10/23/21  
11/10/21

dephasing length

$$L_d \sim \frac{\pi c}{\omega_p} \frac{c}{c - v_{gr}} = A_d \frac{c}{c - v_{gr}}$$

↑  
dephasing length

$$= \left[ \frac{\pi c}{\omega_p} \right] \frac{1}{1 - \sqrt{1 - \frac{\omega_p^2}{\omega^2}}}$$

pulse length (≲ thickness of drift) astrophysical

This changes when  $a_0 \gg 1$ , as it is theoretically not pulse length

$$= \left( \frac{1}{2} \frac{\pi c}{\omega_{p0}} \right) \frac{\omega^2}{\omega_{p0}} \boxed{a_0^{3/2}} = \frac{1}{2} A_d \left[ \frac{\omega^2}{\omega_{p0}^2} \right] a_0$$

pulse length

ponderomotive force TT 10/23/21

$$F_p = m \omega c a_0$$

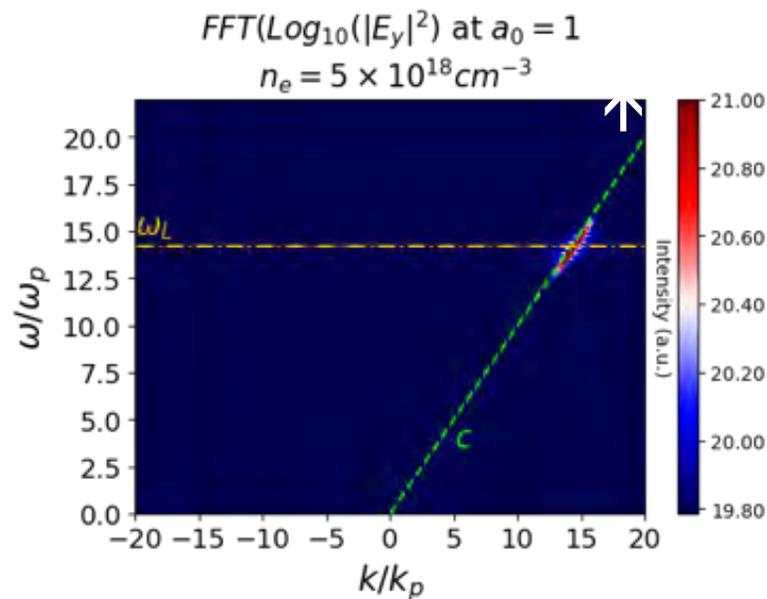

Energy Gain

$$W_{\text{max}} = \frac{1}{2} m \omega c a_0^2 + A_d \left( \frac{\omega^2}{\omega_{p0}^2} \right)$$

# PHY249(fall2021)LWFA (E. Barraza et al.):

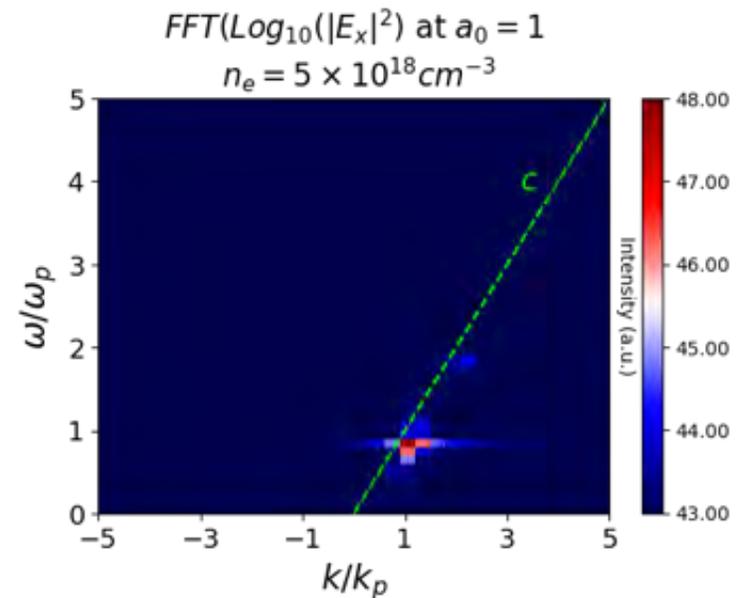

$$\lambda_{laser} = 1.05 \mu m$$
$$n_e = 5 \times 10^{18} cm^{-3}$$

Group velocity of photons

The pulse of laser appears just below the light cone obeying the dispersion relation  $\omega^2 = \omega_p^2 + k^2 c^2$ , where the group velocity of light is  $v_{gr} = c \sqrt{1 - \omega_p^2 / \omega^2}$

Phase velocity of plasma wave (wake)

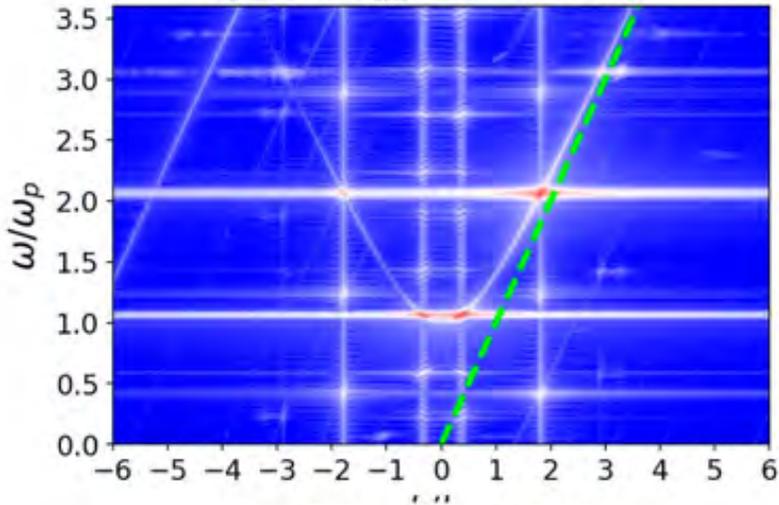

The excited wake behind the laser pulse also sits right below the light cone where the phase velocity of the plasma wave obeys  $v_{ph} = \omega_p / k_p = v_{gr}$

# Dispersion Relations from small to large

In high densities, we get broad  $v_{ph}$

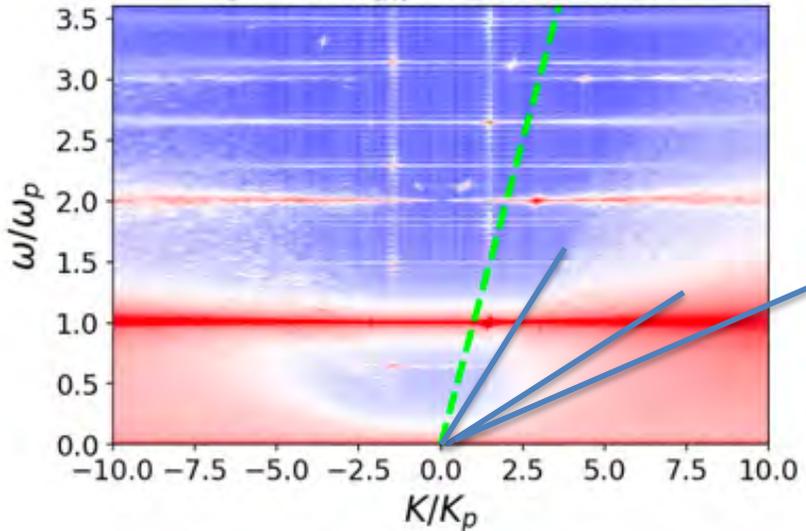

FFT( $E_y$ ) at  $a_0 = 0.03$

$n_e = 0.9 \cdot n_{crit} = 0.9 \times 10^{21} \text{cm}^{-3}$

FFT( $E_x$ ) at  $a_0 = 0.03$

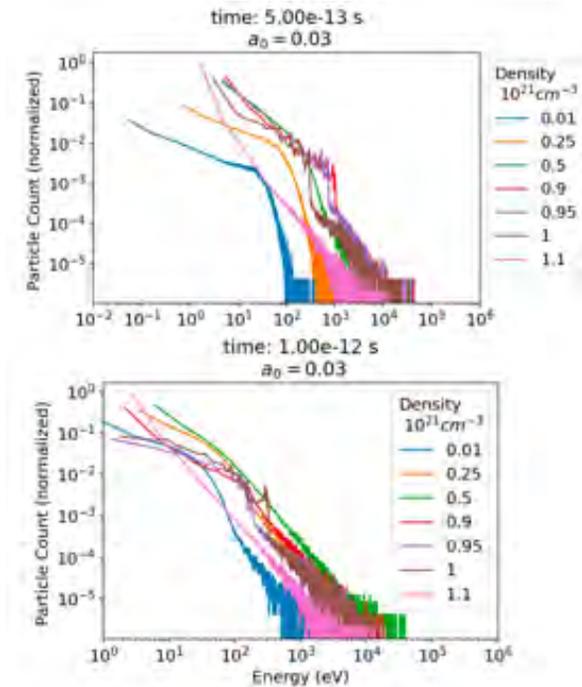

$n_e = 0.9 \cdot n_{crit} = 0.9 \times 10^{21} \text{cm}^{-3}$

Smaller  $v_{ph} \rightarrow$  smaller  $v_{tr} \rightarrow$  smaller saturated  $E$   
 $\rightarrow$  Less energetic electrons accelerated

Larger  $v_{ph}$  can trap electrons to greater energies

Broader trapping ranges  $\rightarrow$  higher efficiency, non-monoenergy

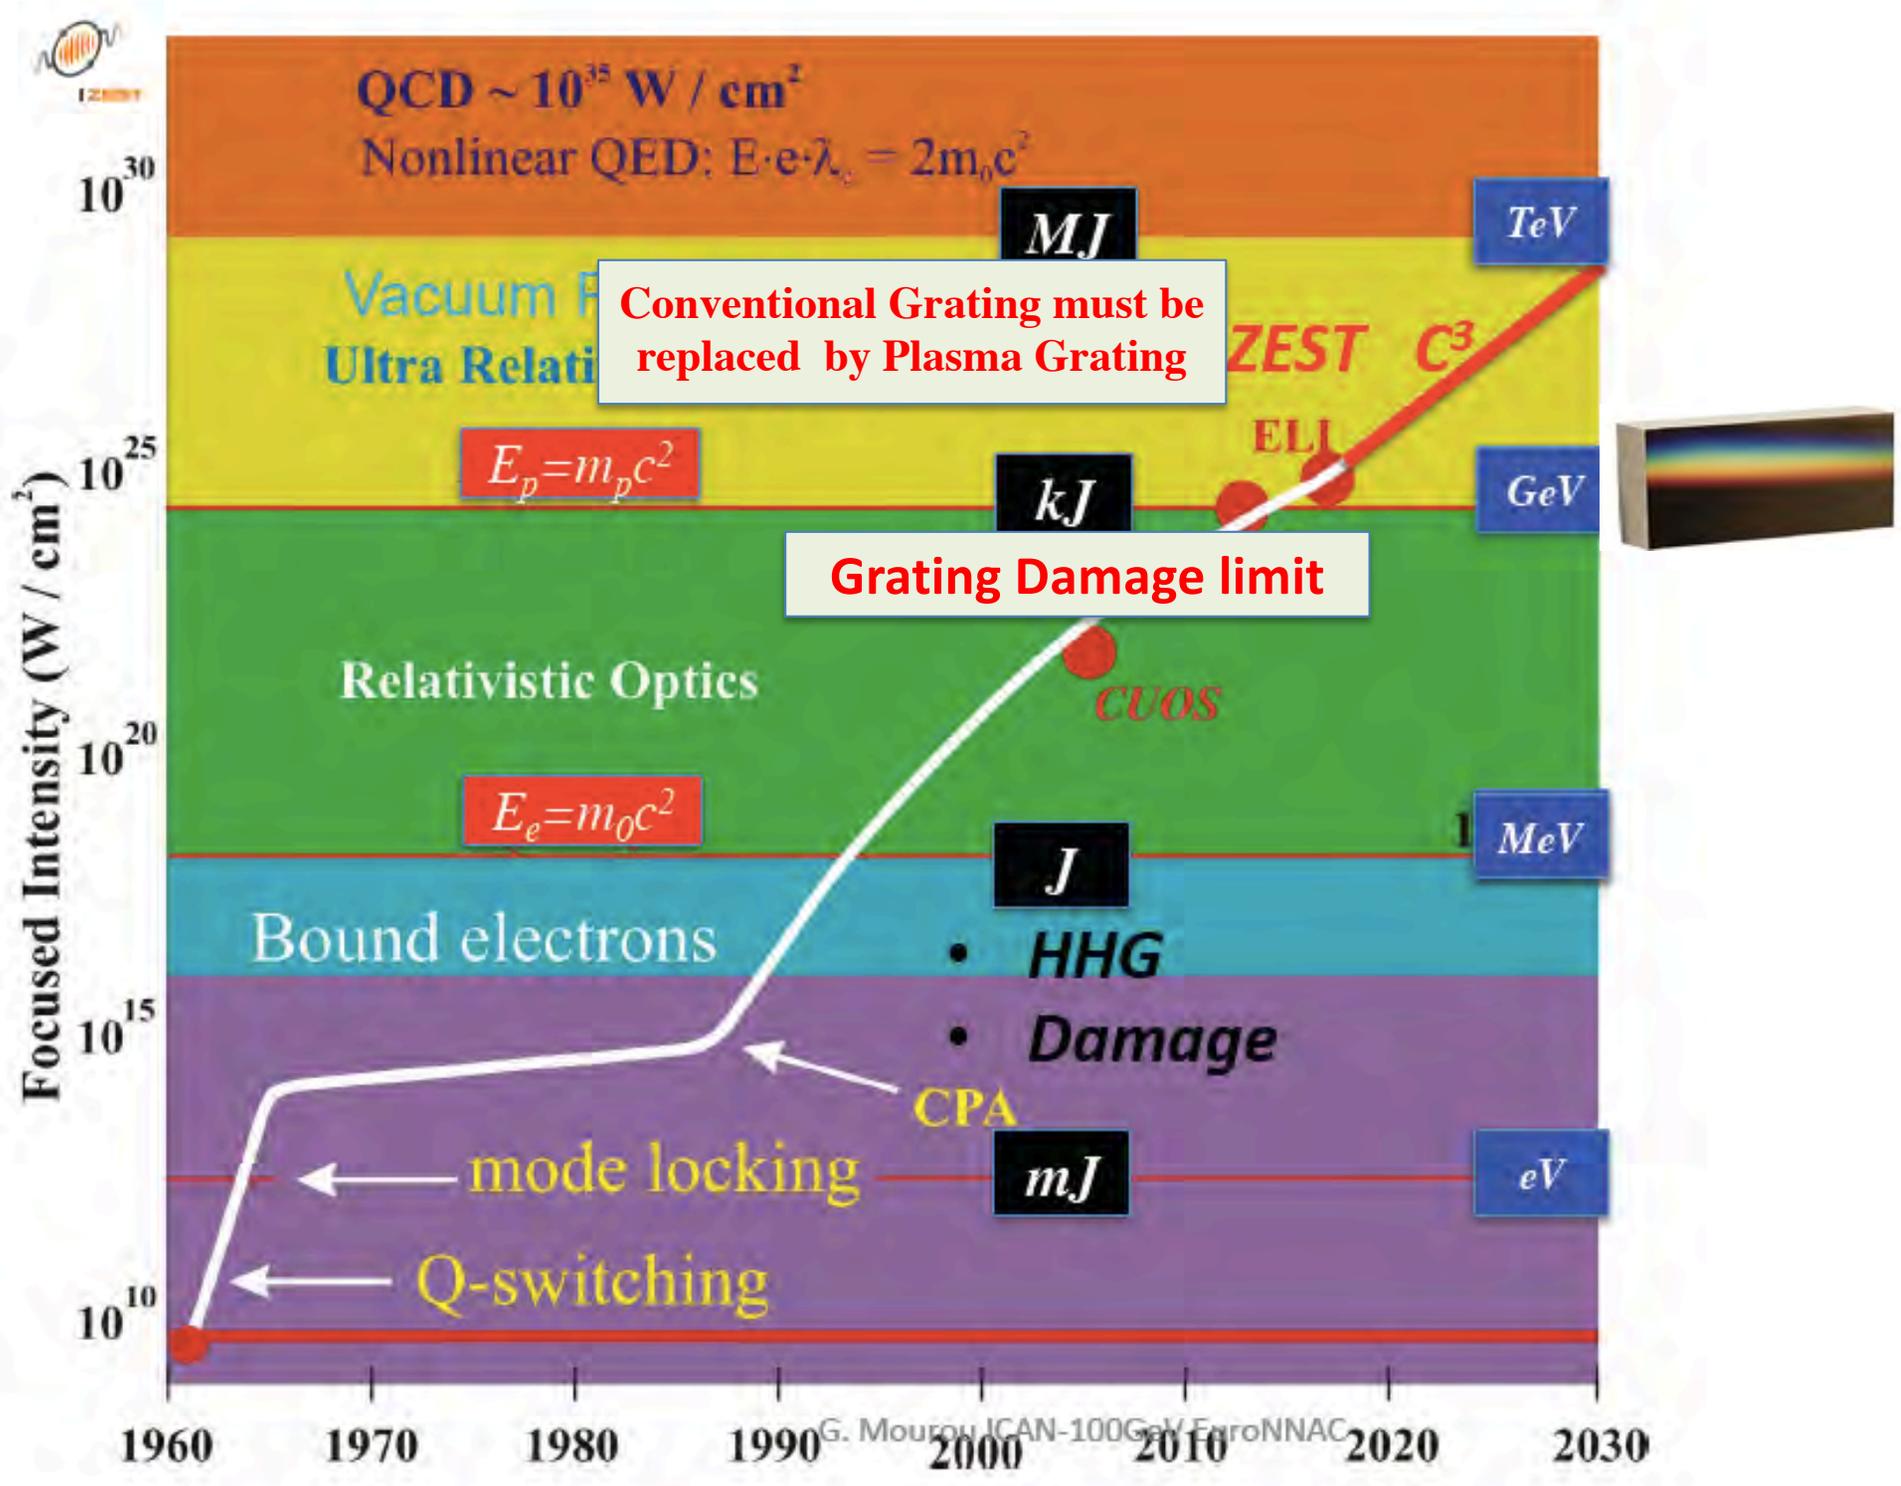

# HD LWFA

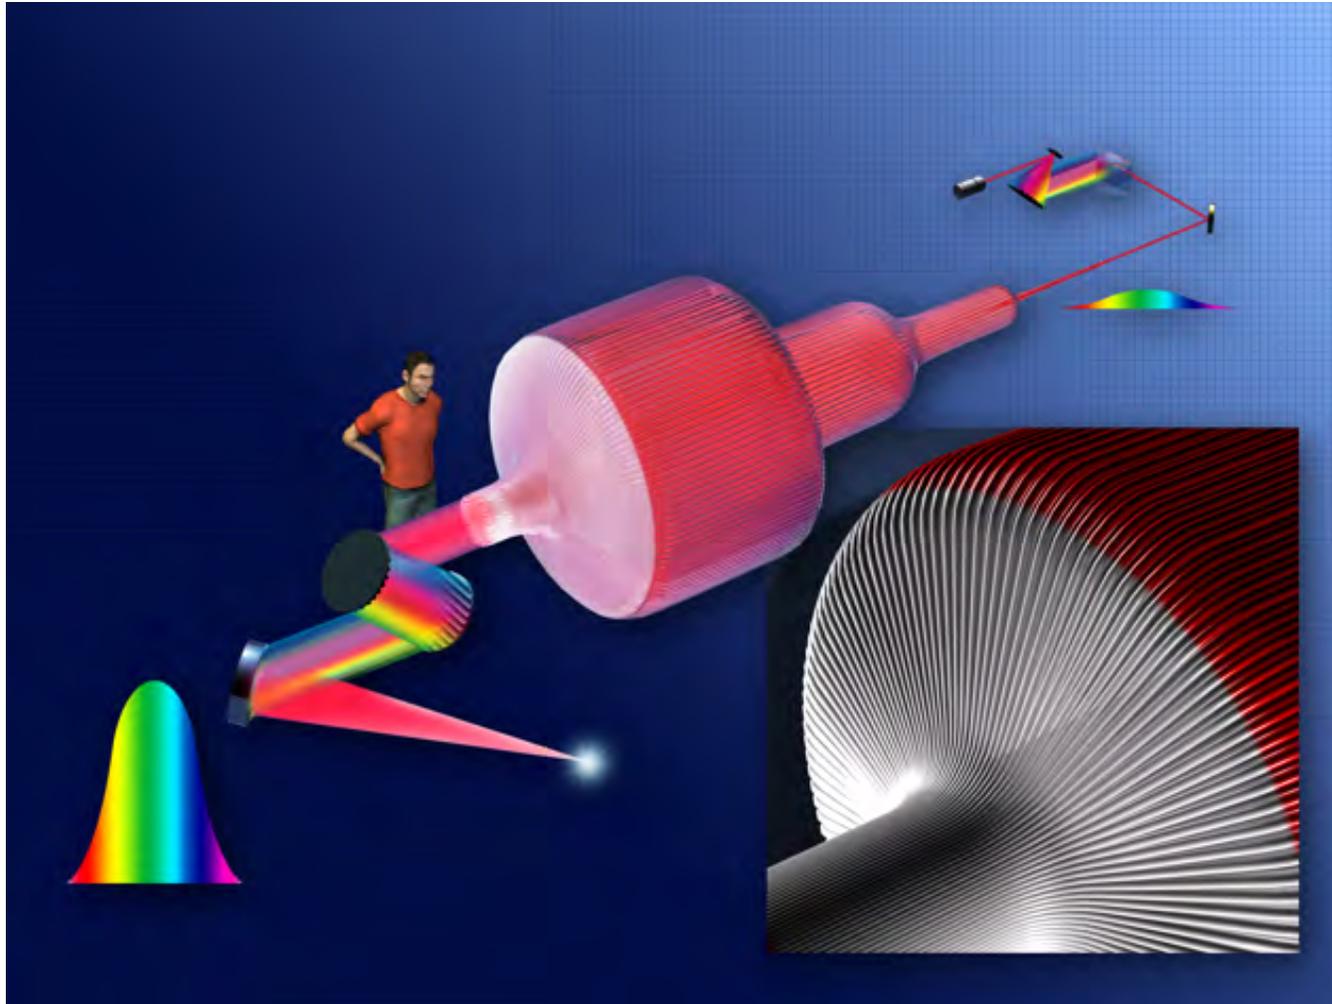

- Low energy acceleration  $\sim n_{cr} / n_e$
- Tiny acceleration length  $\sim$  micron  
 $L_d \sim (c / \omega_p) (n_{cr} / n_e)$
- Higher efficiency
- Less mono-energetic

(we need to further check  $a_0$  and  $n_{cr} / n_e$  dependences)

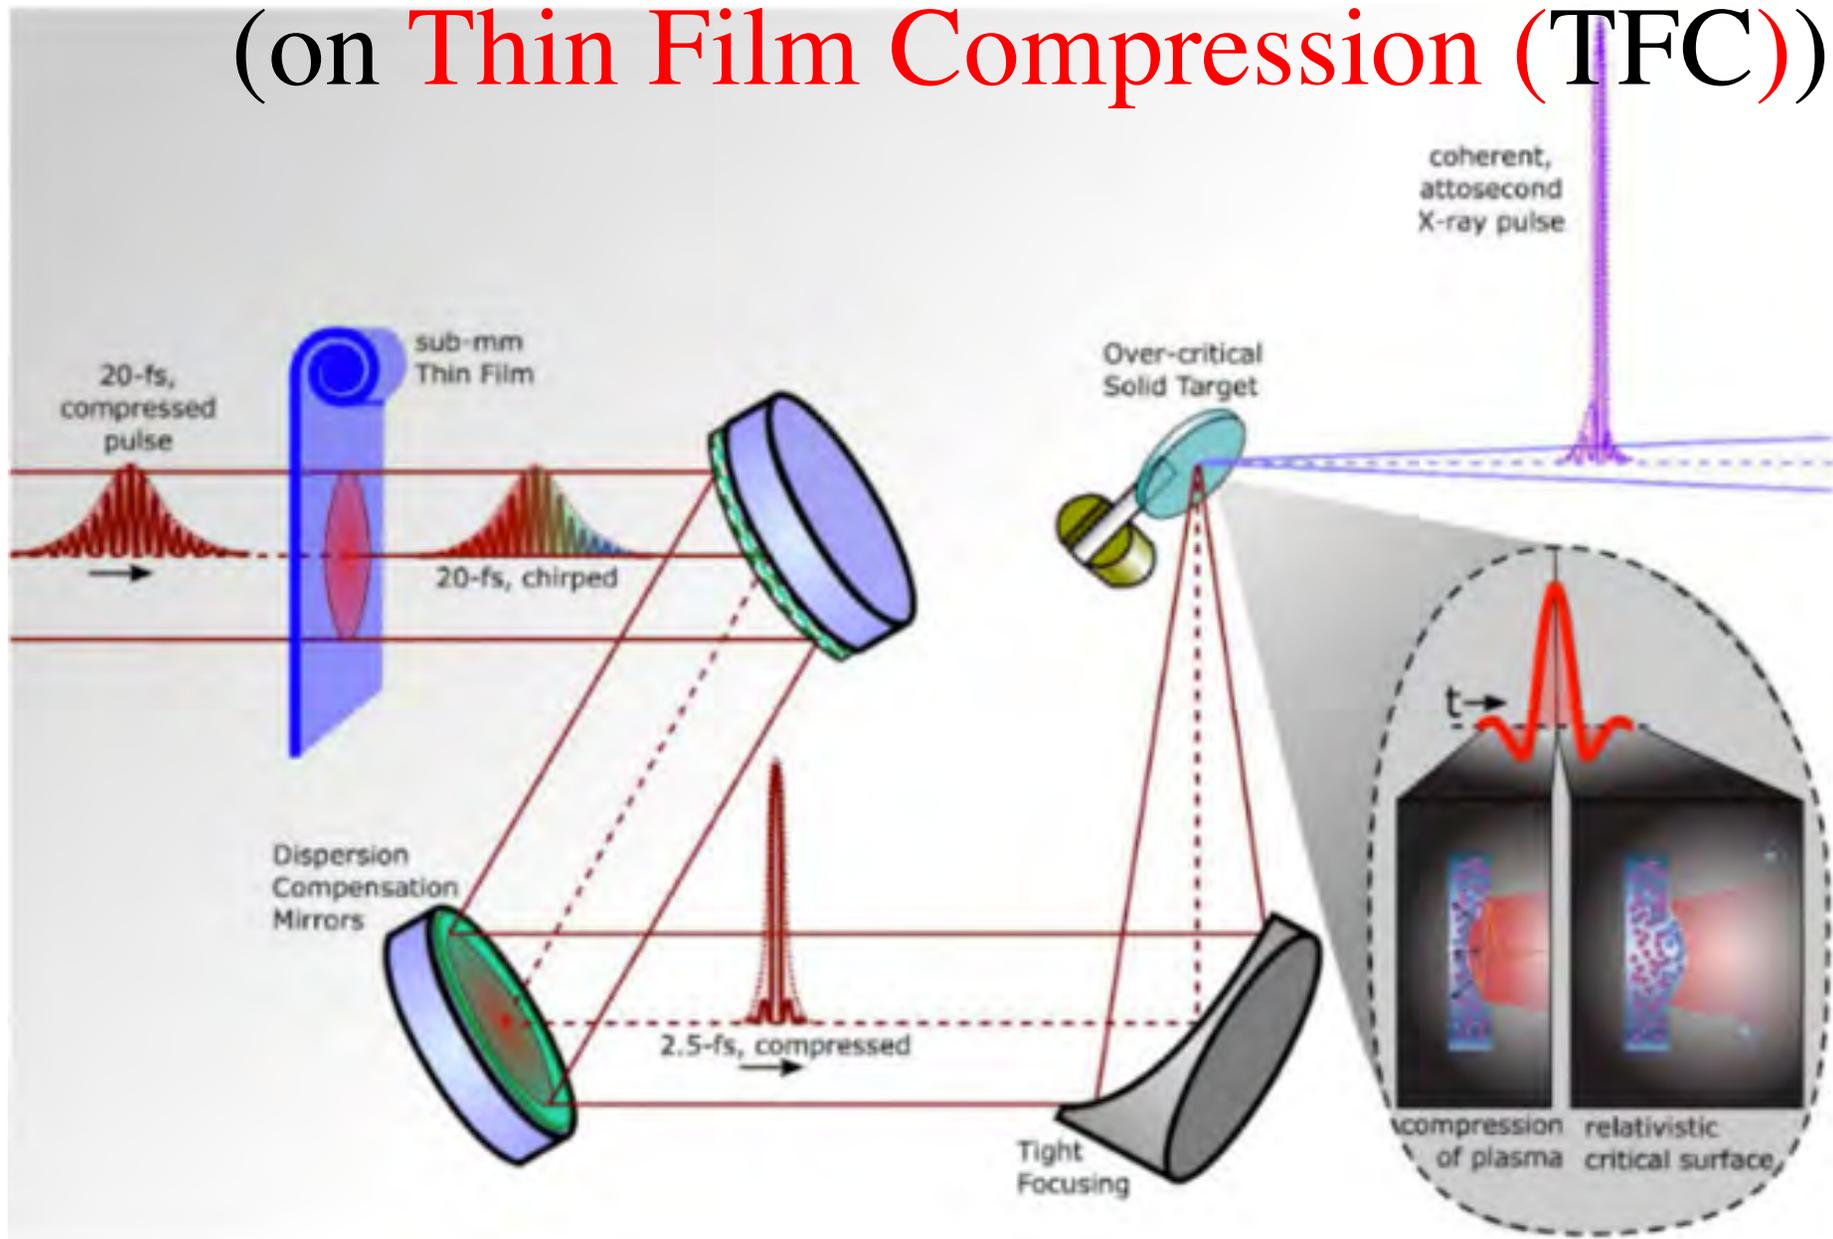

Single-cycled **laser** and “TeV on a chip”

# Next Generation X-ray Lasers (on Thin Film Compression (TFC))

# Motivation:

1. Invention of **Thin Film Compression** (TFC, 2013) opened up **Laser Wakefield Acceleration** (LWFA, 1979) in **X-ray** regime,

$$E_{TD} = m\omega_{pe} c / e; \quad \Delta\varepsilon = 2mc^2 a_0^2 (n_{cr} / n)$$

compactifying further by  $10^3$  over the gas plasma LWFA

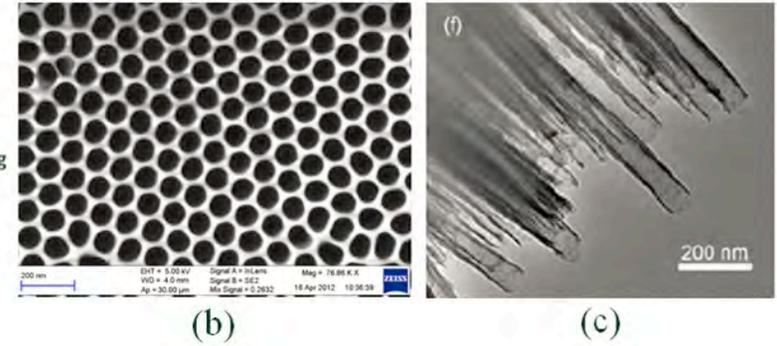

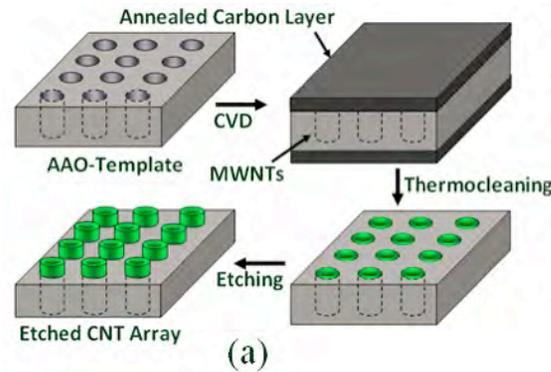

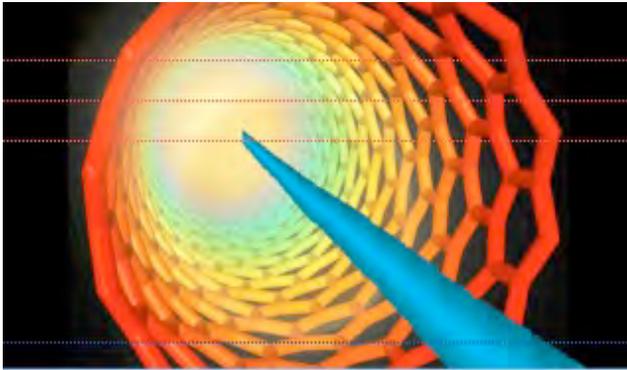

2. X-ray frequency exceeds the nanomaterial's plasma frequency  $\omega_{pe}$

→ **carbon-nanotubes**

higher than 10TV/m wakefield (2014)

→ Explore **X-ray** wakefield accelerator in nanotube = “TeV on a Chip”

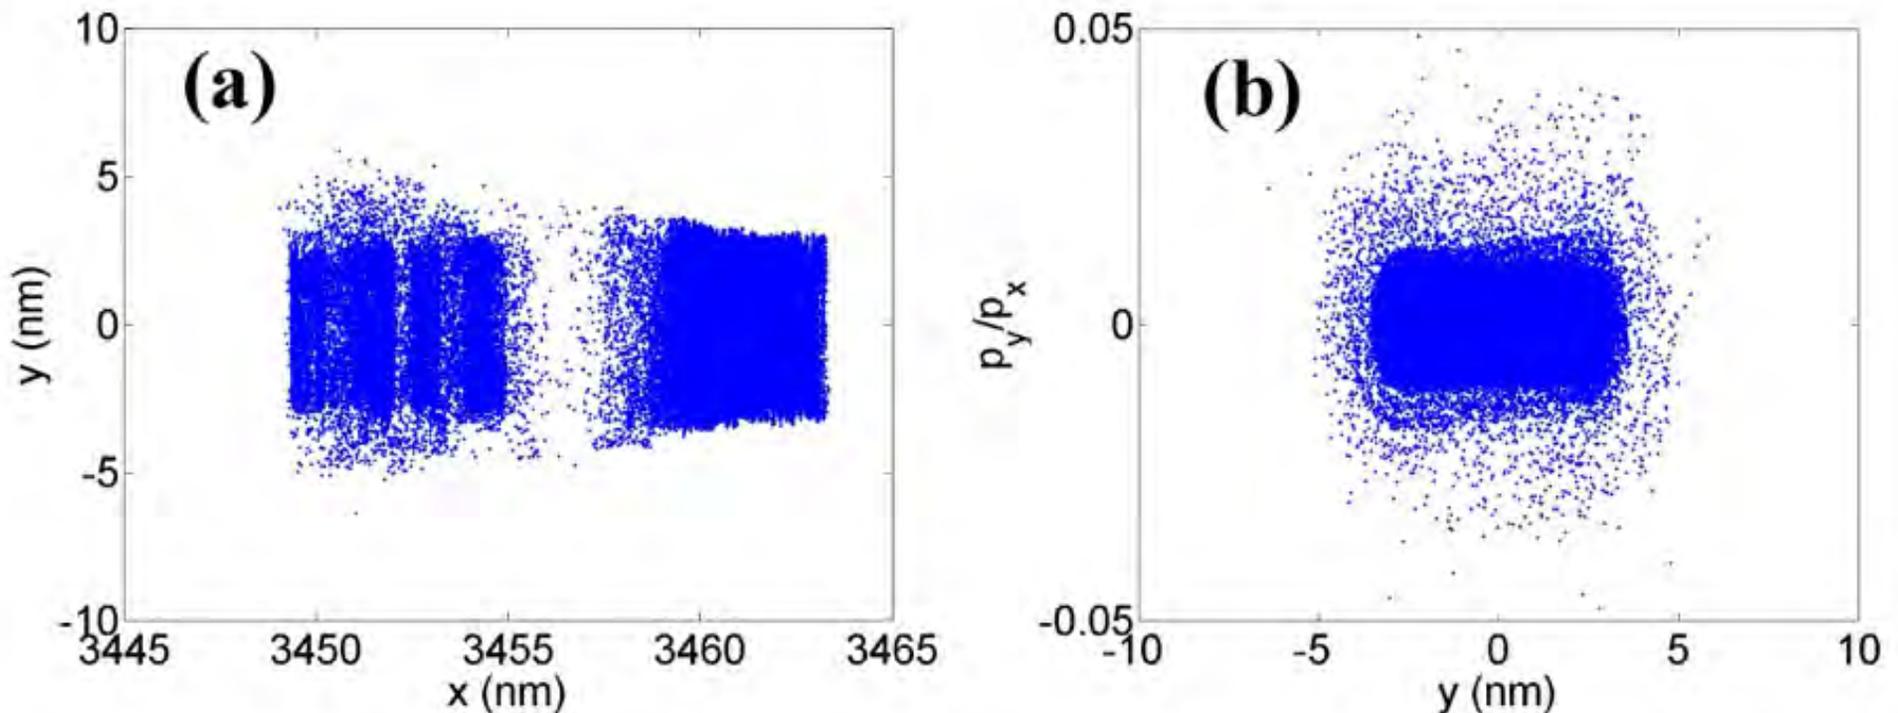

# Why Nanotubes

- High density ↔ Higher acceleration gradient ( $\sim \text{TeV} / \text{cm}$ )
- Provides external structure to guide laser and electron beam
- No slowdown of electrons by collisions
- Intact for time of ionization (fs)
- More coherent electrons and betatron radiation

# Beam emittance reduction

X-ray laser driven wakefield  
emittance reduction (much smaller transverse dimension)

(a) The space distribution  $(x, y)$  and (b) the transverse phase space  $(y, p_y/p_x)$

$$\alpha = \frac{\hbar^2}{e c}$$

# Fermi's PeV Accelerator

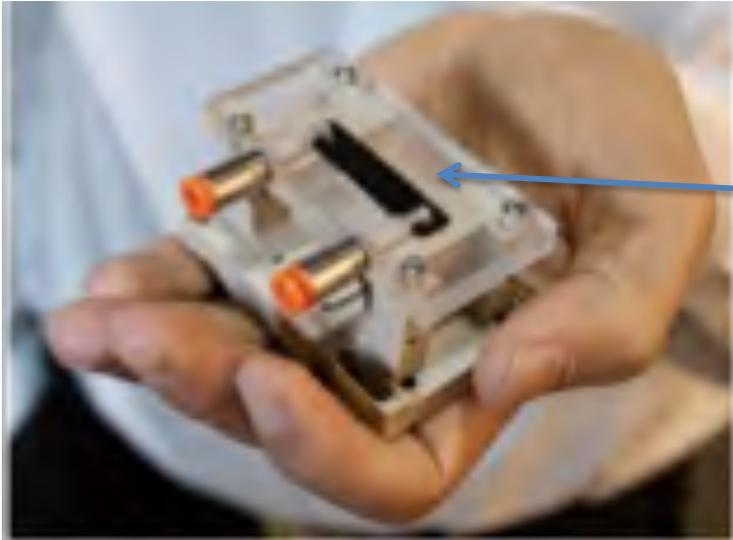

Now

TeV on a chip  $\rightarrow$  PeV over 10m  $\rightarrow$  check superstring theory?

# 1. Background

- New invention toward ultrashort-pulsed higher frequency photon: **Thin Film Compression (TFC)** [Mourou et al. 2014] and its demonstration [Farinella et al., 2019]
- Its use toward X-ray laser driven **nanotube** accelerator-  
“**TeV on a chip**”: [Tajima, 2014], [Zhang et al. 2016]
- SIOM launched **SEL** (Station for Extreme Light): marriage between PW lasers and XFEL [2017]
- → Need of higher energy, higher intensity **X-ray lasers**
- SIOM: Center of materials science (**nanotechnology**)  
emergence of **nanomaterials**

## 2. Compact **laser-driven electron** accelerator

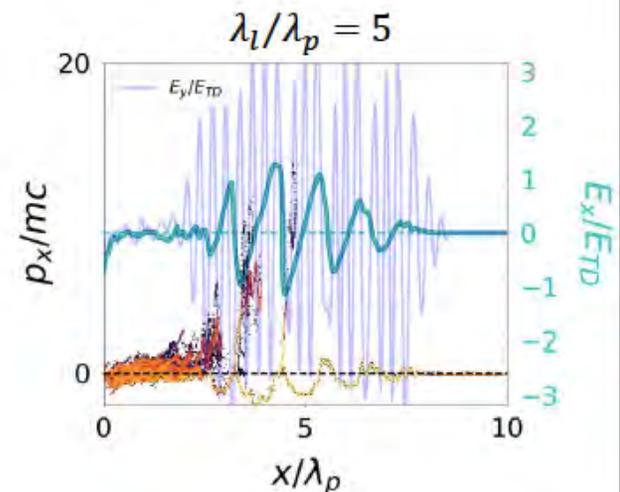

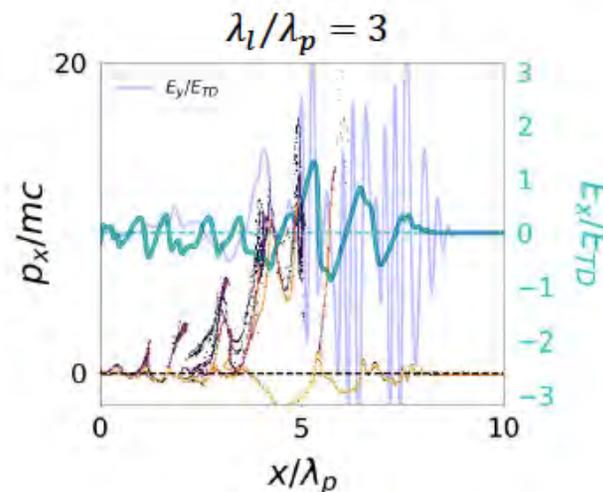

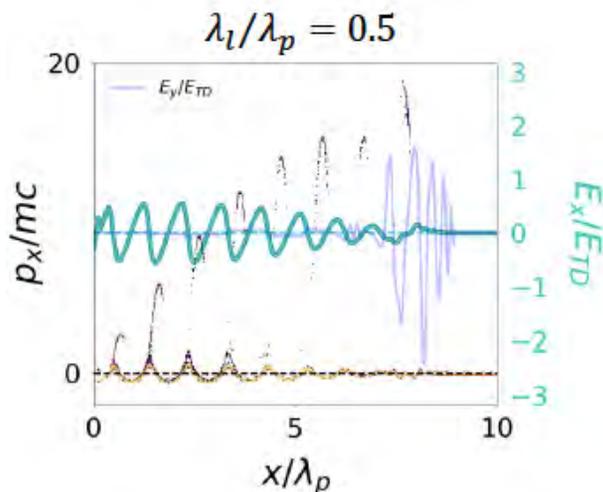

**Laser** accelerator (invented: Tajima-Dawson, 1979)

First expt (Nakajima et al., 1994); 100s of realizations

**Nanotube** version of **laser-driven electrons** (2019)

- Fiber lasers → long pulse better
- Self-modulation: long pulse breaks → small pulses
- Pulse length  $\lambda_l/\lambda_p$  scanned,  $n_c/n_e = 10$ ,  $a_0 = 1$
- Long pulses → Laser/wakefield modulated

# Motivation:

1. Invention of **Thin Film Compression** (TFC, 2013) opened up **Laser Wakefield Acceleration** (LWFA, 1979) in **X-ray** regime,

$$E_{TD} = m\omega_{pe} c / e; \quad \Delta\varepsilon = 2mc^2 a_0^2 (n_{cr} / n)$$

compactifying further by  $10^3$  over the gas plasma LWFA

2. X-ray frequency exceeds the nanomaterial's plasma frequency  $\omega_{pe}$

→ **carbon-nanotubes**

higher than 10TV/m wakefield (2014)

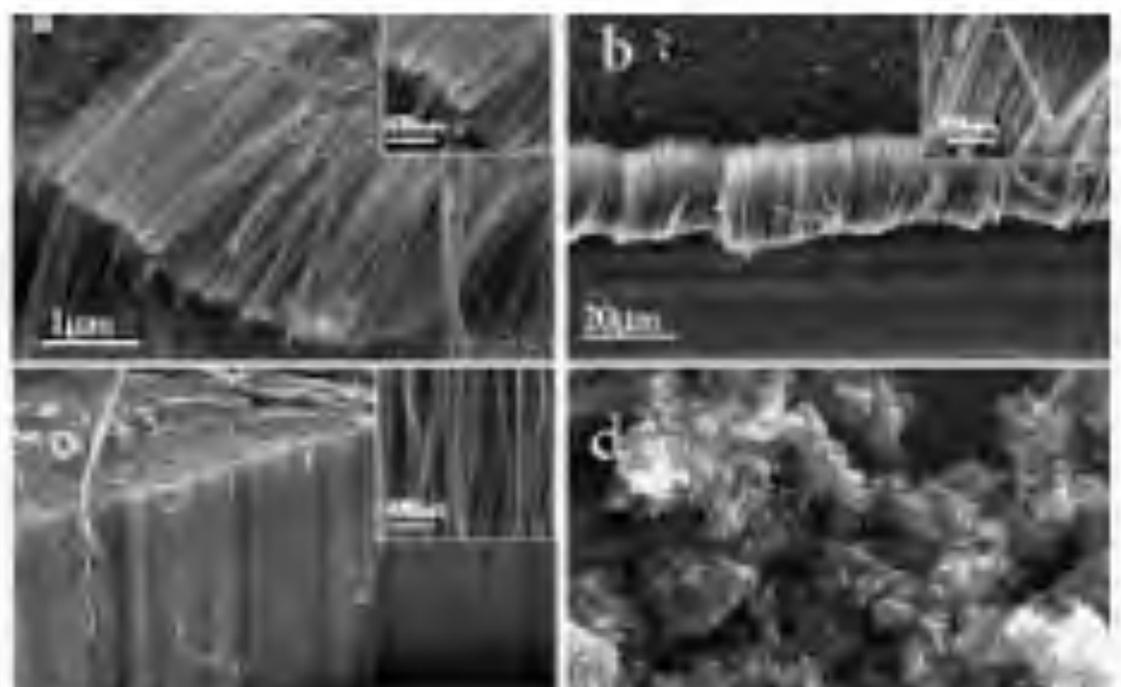

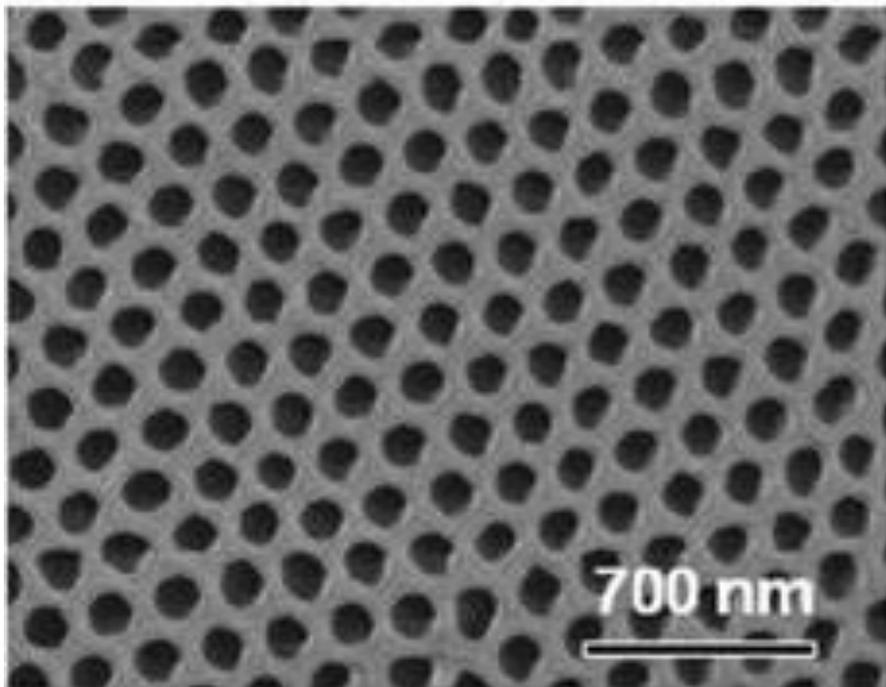

→ Explore **X-ray** wakefield accelerator in nanotube = “TeV on a Chip”

# 3. Nanotubes

- Emergence of nanotubes and nanotechnology  
--discovery of CNT by Iijima (1991)
- Taborek et al. (2000's):

nanotube arrays ;

nanoforest

## 4. Marriage of **Intense Lasers** and **Nanotechnology**

- **Laser wakefield accelerators (LWFA):** more compactified with nanotubes
- LWFA: with higher frequency photons (e.g. X-rays)  
→ TeV on a chip
- Betatron oscillations in nanotubes → more coherent, high frequency, shorter pulsed **X-rays**
- Accelerators and X-rays in your stomach; cope with COVID etc.
