GOAL: VERY HEURISTIC LOOK AT THE MATHEMATICS "UNDER THE HOOD" OF THE NONABELIAN ANOMALY.

WE WILL CONNECT TO MANY OF THE GEOMETRIC TOPICS THAT HAVE COME UP THIS ~~SEMESTER~~ SEMESTER IN OUR JOURNAL CLUB, BUT THE GOAL IS THAT YOU SHOULD BE ABLE TO APPRECIATE THE DISCUSSION WITHOUT HAVING PAID TOO MUCH ATTENTION.

PART I: A REVIEW OF THE YM LAGRANGIAN:  $\int$  PATH INTEGRAL  
 FADDEEV POPOV  
 TRICK  
 EVERYONE ALREADY KNOWS THIS!

• NAIVE ACTION DOESN'T WORK:

$$\begin{aligned} \mathcal{L}_{YM} &= -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \quad (\text{or } -\frac{1}{4g^2} F_{\mu\nu} F^{\mu\nu}) \\ &= \frac{1}{2} A^\mu \underbrace{(\eta_{\mu\nu} \square - \partial_\mu \partial_\nu)}_W A^\nu \end{aligned}$$

KINETIC OPERATOR  
 INVERSE SHOULD GIVE THE GAUGE FIELD PROPAGATOR

BUT THIS OPERATOR HAS NO INVERSE!

• WE KNOW WHY: PATH INTEGRAL OVER  $A_\mu$  (unconstrained) CONTAINS ALL GAUGE-REDUNDANT CONFIGURATIONS

↳ ie WE ARE INTEGRATING OVER A SPACE THAT IS 'INFINITELY' LARGER THAN THE PHYSICAL CONFIGURATION SPACE.

ALONG A GAUGE ORBIT THE ACTION IS CONSTANT (BY GAUGE INVARIANCE) THIS FOR EACH PHYSICALLY DISTINCT CONFIGURATION IN THE PATH INTEGRAL, THERE IS A MULTIPLICATION BY  $vol G$  ASSOCIATED WITH THE VOLUME OF THE GAUGE GROUP.

↳ THIS IS WHAT IS MAKING OUR NAIVE ACTION MISBEHAVE.

• BUT THIS MEANS  $\int dA = (VOLUME\ OF\ G) \int_{phys}$  ← PI OVER PHYSICAL CONFIGURATIONS. (GAUGE FIXED)

↑  
formally infinite

↙ naive

$$Z = \int dA e^{iS[A]}$$

BUT OVERALL PREFACTOR — EVEN INFINITE ONE — DOES NOT AFFECT THE GENERATING FUNCTION.

SO  $Z$  STILL WORKS, WE JUST HAVE TO PULL OUT THE  $(vol G)$  FACTOR.

SOLUTION: FADDEEV-POPOV PROCEDURE

[ We will be very sketchy - you've already done the technical steps in your QFT courses! ]

IDEA: INTRODUCE A "LAGRANGE MULTIPLIER" TO ENFORCE A GAUGE CHOICE.

TRICK:  $1 = \int dg \left( \det \frac{\delta f[A^a]}{\delta g} \right) \delta(f[A^a])$

INTEGRAL OVER GAUGE ORBITS! THIS IS PRECISELY THE PREFACTOR THAT WE WANT TO RUL OUT

JACOBIAN  $\equiv \Delta_{FP}$

$f[A^a] = 0$  IS A GAUGE-FIXING CONDITION

CAUTION:  $f[A^a] = 0$  MUST HAVE A UNIQUE SOLUTION  $g(G)$   $\forall A_\mu(G)$ . OTHERWISE, CAN GET PROBLEMS, eg GREEN AMBIGUITY.  
 ↓  
 eg WILSON GAUGE CANNOT BE GLOBALLY DEFINED.

PHI:  $f(A) = 0$  NOT POSSIBLE  $\forall A$ , OTHERWISE SPACE IS TOPOLOGICALLY TRIVIAL.  $f(A) = 0$  IS POSSIBLE FOR SMALL  $A \rightarrow$  PERT THY.

THEN WE ARGUE THAT:

$$Z = \int dA dg \Delta_{FP}[A^a] \delta(f[A^a]) e^{iS[A]}$$

$$= \int dg \cdot \int dA \Delta_{FP}[A] \delta(f[A]) e^{iS[A]}$$

$\int dA, \delta[A], dg$  ARE GAUGE INV.

$$= \int dg \cdot Z_{phys} \leftarrow Z \text{ GAUGE FIXED.}$$

$\uparrow$   
(Vol G)

BUT WE NEED TO MASSAGE IT TO LOOK LIKE A NORMAL PARTITION FUNCTION. HAVE TO SEND  $\Delta_{FP}[A] \delta(f[A])$  INTO THE EXPONENTIAL.

IN FACT, IT IS EASY TO GENERALIZE TO  $f[A] - b(x) = 0$  GAUGE FIXING,  
 AND THEN INTEGRATE OVER GAUSSIAN FUNCTIONAL WEIGHT FOR  $b(x)$   
 SO THAT

- ① WE CAN ENCODE THE  $\delta$ -FUNCTION INTO THE  $\mathcal{L}$
- ② WE INTRODUCE THE FP GHOST PARAMETER

$$Z = (\text{Vol } G) \int db e^{-\frac{i}{2\xi} \int dx b^a(x) b^a(x)} \int dA \Delta_{FP}[A] \delta(f[A] - b) e^{iS[A]}$$

$\underbrace{\hspace{10em}}_{\text{GAUSSIAN WEIGHT (threw out overall normalize)}}$

$$= (\text{Vol } G) \int dA \Delta_{FP}[A] e^{iS[A] - \frac{i}{2\xi} \int dx f^a[A] f^a[A]}$$

$$\Delta_{FP}[A] = \det \frac{\delta f[A^g]}{\delta g} \Big|_{g=1} = \det \frac{\delta f[A^g]}{\delta \Lambda} \Big|_{\Lambda=0}$$

CONSIDER INFINITESIMAL GAUGE TRANSF:  $g = 1 + \Lambda$

TO PUT THIS IN THE EXPONENTIAL WE USE THE TRICK THAT  
FERMIONIC GAUSSIAN INTEGRALS ARE PROPORTIONAL  
 TO DETERMINANTS (cf. BOSONIC GAUSSIANS GO LIKE  
 AN INVERSE POWER OF THE DETERMINANT.)

$$\det \frac{\delta f}{\delta \Lambda} = \int d\bar{c} dc e^{-i \int dx \bar{c} \frac{\delta f}{\delta \Lambda} c}$$

DIFFERENCE IN AXIOM CASE,  
 BUT PROPORTION IS VERY.

FP GHOSTS: INDEPENDENT ADJOINT SCALAR FIELDS  
 W/ GRASSMAN STATISTICS.  
 → REPRESENTING NEGATIVE DOF.

A GOOD QUESTION: WHY ARE THE FP GHOSTS ANTI-COMMUTING?

WE WILL TRY TO ANSWER THIS GEOMETRICALLY. → WILL IDENTIFY w/ MAURER-CARTAN FORM.

RESULT:

$$Z = (\text{Vol } G) \int dA d(\text{FERMIONS}) e^{i \int d^4x \mathcal{L}_{YM} + \mathcal{L}_\psi + \mathcal{L}_{GF} + \mathcal{L}_{FP} + \text{SOURCES}}$$

•  $\mathcal{L}_{FP} = -\bar{c}^a \partial^\mu D_\mu^{bc} c^b$   $\hat{=}$  CONTAINS KINETIC PART!

BRS SYMMETRY (or "BRST", BUT TYUTIN NEVER PUBLISHED)

Heuristic motivation: WHAT HAS HAPPENED TO GAUGE INVARIANCE?  
IT SEEMS LIKE WE'VE THROWN IT OUT COMPLETELY. CERTAINLY  $Z_{phys}$  IS GAUGE FIXED.

BUT: WE NEEDN'T WORK W/  $Z_{phys}$ . WE COULD STILL WORK W/  $Z$ .  
IN THE FORM

$$Z = (\text{Vol } G) Z_{phys}$$

$Z$  IS EQUIVALENT TO  $Z_{phys}$  AS A ~~GAUGE~~ PARTITION FUNCTION (OVERALL NORMALIZATION IS IRRELEVANT!), AND  $Z$  IS SUPPOSED TO BE GAUGE INVARIANT:

$$Z = \int d(\text{GAUGE ORBITS}) \cdot Z_{phys}$$

↑ FIXED GAUGE ORBIT

⌋ BUT:  $\int d^4x V^{\mu}(x)$  IS NOT LORENTZ INV.

BUT:  $\int d^4x \int d\Omega V^{\mu}(x)$  IS LORENTZ INV.

↑ INTEGRATE OVER ORIENTATIONS OF  $V^{\mu}$

(very rough analogy.)

SO WE COULD ASK: WHERE DID THIS GAUGE INVARIANCE GO?  
IS THERE ANY TRACE OF IT IN  $Z_{phys}$ ?

"Practical" MOTIVATION: WE WANT (NEED) SOME REMNANT OF GAUGE SYMMETRY TO PROVE THE RENORMALIZABILITY OF YM.

GAUGE TRANSFORMATION:  $A_{\mu}^a \xrightarrow{g(x) = 1 + \lambda^a(x) T^a} A_{\mu}^a + D_{\mu}^{ab} \lambda^b(x)$

CLAIM: WE HAVE OTHER FIELDS (semi dynamical) IN OUR  $Z$   
AND WE HAVEN'T SPECIFIED THEIR TRANSFORMATION.

WE CAN GENERALIZE GAUGE INVARIANCE TO INCLUDE THE TRANSFORMATION OF THE GHOST FIELDS

⌋ BRS (T)

NOTE: FOR THIS TALK, I REALLY DON'T CARE ABOUT THE DETAILS OF THE BRST TRANSFORMATION.

SIMPLEST FORM:

$$\delta_c A_\mu = D_\mu V$$

converts into ghost

this is a gauge transf where the ghost is the trans. param!

ops.  $\delta_c$  CARRIES GHOST #

$$\delta_c c = -\frac{1}{2}[V, V] \quad \leftarrow \text{adjoint}$$

$$\delta_c \psi = -V \psi$$

$$\delta_c \bar{\psi} = -\bar{\psi} V$$

REMARKS: • WHAT ABOUT  $\delta_c \bar{V}$ ?

YOU CAN DETERMINE THIS MOST EASILY BY INTRODUCING AN AUXILIARY FIELD. SEE, EG, PERKIN § 16.4.

THIS IS A TECHNICAL DETAIL.

- TRANSF INCLUDE (IE GENERALIZE) 'NORMAL' GAUGE TRANSF.
- "CHOSEN" SO THAT  $\delta_c^2 = 0$ , NILPOTENT

PHYSICS: THE PHYSICAL CONTENT OF A GAUGE THEORY LIES IN THE KERNEL OF THE BRST OPERATOR MODULO THE IMAGE OF THE BRST OPERATOR.

↳ I.E. THE PHYSICS IS IN THE COTRANSDUCTION.

VERY HEURISTICALLY: FOR EXAMPLE, I CAN ALWAYS ADD A FINITE LOCAL COUNTER TERM FROM THE IMAGE OF  $\delta_c$  (eg  $\delta_c f$ ). THIS TERM IS INDEPENDENTLY BRST-INVARIANT ( $\delta_c^2 = 0$ ) BUT CAN BE USED TO CANCEL ANY OTHER TERMS IN THE IMAGE OF  $\delta_c$ .

Physically (see Perkin 16.4):  $\delta_c$  TRANSFORMS UNPHYSICAL GHOSTS & GLUON POLARIZATIONS INTO ONE ANOTHER, BUT ANNIHILATES PHYSICAL GLUON POLARIZATIONS.

OFF HAND REMARKS

1. WE CAN TAKE THIS FURTHER & USE BRST AS A BASIS FOR QUANTIZING OUR THEORIES. See Polchinski I, Weinberg II, 15.8

↳ THIS IS DONE, FOR EXAMPLE, IN STRING THEORY. (It is usually the third way that you learn to quantize the bosonic string.)

2. BRST IS IMPORTANT FOR THE <sup>manifest</sup> UNITARITY OF THE S-MATRIX SINCE IT CAN BE USED TO SHOW THAT PHYSICAL POLARIZATIONS DON'T LEAVE IN UNPHYSICAL POLARIZATIONS.

↳ See Peskin 16.4

"ON HAND" REMARKS

1. GHOSTS ARE STILL "MYSTERIOUS"

↳ WHY DO THEY ANTICOMMUTE?

↳ GEOMETRIC MEANING?

↳ PROPERTIES OF  $\xi$ ?

haven't really done anything, just words

2. THE BRST INVARIANCE WE'RE "SHOWED" HERE IS @ THE CLASSICAL LEVEL.

A GOOD QUESTION IS: IS THE QUANTUM ACTION BRST INVARIANT?

$$Z = e^{iW} \quad \left\{ \begin{array}{l} \text{QUANTUM ACTION} \\ \text{(BY WHICH I MEAN GENERATING FUNCTIONAL} \\ \text{OF CONNECTED DIAGRAM)} \end{array} \right.$$

WARD / SLAVNOV-TAYLOR IDENTITY:  $\boxed{\delta_c W = 0}$

OR

"ANOMALOUS WARD IDENTITY"

ANOMALY (non-Abelian):  $\boxed{\delta_c W = G \neq 0}$

KEY RESULT (somewhat trivial): WZ CONSISTENCY:  $\delta_c^2 W = \delta_c G = 0$

# PART II : CONSISTENT ANOMALY

GOAL : INVESTIGATE ANOMALOUS WARD IDENTITIES A BIT MORE  
next part: a few words about solving

REVIEW : ANOMALY : SYM OF CLASSICAL ACTION IS NOT A SYM OF THE QUANTUM ACTION

PERTURBATIVELY : ABJ / CHIRAL / SINGLET ANOMALY FROM TRIANGLE DIAGRAMS W/ CHIRAL FERMIONS.

NON-PERTURBATIVELY : FUJIKAWA — COMES FROM THE NON-INVARIANCE OF THE PATH INTEGRAL MEASURE.

~~RELATED TO NON-ABELIAN~~

NON-ABELIAN ANOMALY : RELATED TO GAUGE BACKGROUND OF INSTANTONS

in fact, Yang already remarked on this relation in his talk.

see Flip's A EXAM

"LOTS OF PEOPLE ARE READING IT" — Z. KOMARBOOSKI

ANOMALIES ARE INTIMATELY TIED TO FERMION ZERO-MODES (massless excitations); the presence of a nontrivial GAUGE CONFIGURATION CAN GENERATE FERMION ZERO MODES. THIS IS ESSENTIALLY WHAT THE 't HOOFT VERTEX DOES. [MORE INTUITIVE : FESHBACH'S EXPLANATION OF HOW A GAUGE TRANSFORM CAN SHIFT THE CO LADDER ~~OF~~ IN THE FERMION SPECTRUM.]

CAN FURTHER SHOW THAT ANOMALIES MANIFEST THEMSELVES ONLY IN THE PHASE OF THE DIRAC OPERATOR.  
SEE YAKAHARA B.3.

WE ARE PARTICULARLY INTERESTED IN THE NON-ABELIAN ANOMALY & ITS RELATION TO BRST & GEOMETRY.

PHYSICS : AN ANOMALY IN AN HONEST-TO-GOODNESS GAUGE SYMMETRY IS AN INCONSISTENCY IN THE THEORY & CANNOT BE TOLERATED. (this is why SUPERSTRINGS LIVE IN 10 DIM.) THIS IS BECAUSE GAUGE SYM IS NOT A-SYM, IT IS A REDUNDANCY IN OUR DESCRIPTION. HOWEVER, FOR THIS ANALYSIS WE MAY "NEARLY GAUGE" AN ANOMALOUS GLOBAL SYMMETRY.

There is a lot of physics that I am skipping re: anomalies. Fortunately, you all already know all of it (see Weinberg II or the book by Fujikawa.)

↳ MARIO WILL COVER GRAVITATIONAL ANOMALIES IN 2 WKS. IF YOU HAVE ANY QUESTIONS, PAUL GINSBURG IS ONE OF THE EXPERTS ON ALL OF THIS.

SOME FAMILIAR RESULTS (perturbative analysis)

$$D^k j^s = \frac{1}{4\pi^2} \epsilon^{\mu\nu\rho\sigma} \text{Tr} \partial_\nu (A_\rho \partial_\mu A_\sigma + \frac{2}{3} A_\nu A_\rho A_\sigma)$$

$$D_\nu j^{\mu a} = \frac{1}{24\pi^2} \epsilon^{\mu\nu\rho\sigma} \text{Tr} T^a \partial_\nu (A_\rho \partial_\mu A_\sigma + \frac{1}{2} A_\nu A_\rho A_\sigma)$$

↑  
the one we care about in this talk

↑  
same rough structure... interesting factor of 2/3 vs 1/2

1/2 from 1/2's in P<sub>L</sub> projection  
2/3 from RG scheme which respects gauge sym, but not global (# of gauge vertices in triangle)

[from perturbative point of view we can see where these numerical factors come from... is there something deeper?]

IT IS MORE NATURAL TO WRITE THIS IN GROWN UP NOTATION:

$$D * j^a = \frac{1}{24\pi^2} \text{Tr} T^a d(A dA + \frac{1}{2} A^3)$$

↑

↑  
GAUGE FIELDS ARE ONE-FORMS

~~CURRENT IS MOST NATURALLY A 3-FORM \*j~~  
~~ST. \*j^s IS A VECTOR FROM WHAT COMES~~  
~~ONE CHARGE WHEN INTEGRATED.~~

REMARKS

WE CAN WRITE  $d * j^s = \frac{1}{4\pi^2} \text{Tr} F^2 \sim FF^2$  AS EXPECTED.

BUT WE CANNOT WRITE  $D * j^a$  AS SOMETHING LIKE  $FF^2$ . THIS SOUNDS WRONG! COVARIANCE REQ.  $D * j^a \sim FF^2$ , RIGHT?

TURNS OUT THERE ARE TWO WAYS TO WRITE NON-ABELIAN ANOMALY

- 1. CONSISTENT:  $\int d_4 W = 0$  BUT  $D * j^a$  NOT COVARIANT
- 2. COVARIANT:  $D * j^a \sim FF^2$ , BUT  $\int d_4 W \neq 0$

THEY DIFFER BY A LOCAL BARDEEN-ZUMINO CURRENT (regularization)  
THIS TALK: ONLY #1

WHAT DOES THE DIVERGENCE OF THE CURRENT  $D_\mu j^\mu \sim T_\mu T^\mu \delta W[A] + \frac{1}{2} A^2$  HAVE TO DO WITH THE WZ CONSISTENCY EQN?

$$Z = e^{iW[A]} = \int d(\text{fields}) e^{i \int d^4x \bar{\Psi}_L i \not{\partial} \Psi_L + A_\mu^a j^{\mu a}}$$

$$\delta W[A] = \int d^4x \delta A_\mu \frac{\delta}{\delta A_\mu} W[A] = - \int d^4x c^a \underbrace{D_\mu^{ab} \frac{\delta}{\delta A_\mu^b}}_W W[A] \equiv c \cdot X W$$

"  
DC  
↑  
ghost plays role of gauge transf. parameter

(recall  $D \rightarrow g \not{\partial} g \Rightarrow A \rightarrow A + D\lambda$  for  $g \sim (1+\lambda)$ )

AT LEAST W/RT A TRANSF,  $c \cdot X \sim \delta_c$

FROM EXACT EXPRESSION ABOVE,  $\boxed{\frac{\delta}{\delta A_\mu^a} W[A] = \langle j^\mu_a \rangle}$

$$\Rightarrow \boxed{-D_{\mu\nu}^{ab} \langle j^{\mu b} \rangle = G^a[A]}$$

↑  
RHS OF ANOMALOUS WARD IDENTITY  
~~is~~  $\delta_c W = G$

SO INDEED, THE ANOMALOUS WARD IDENTITY IS TELLING US ABOUT A NONVANISHING DIVERGENCE OF A CLASSICAL CURRENT. ✓

FOR FUTURE REF: WE CAN ALSO COMPLETE THE BRST TRANSF BY INCLUDING THE GHOST TRANSFORMATION:

$$\delta W[c] = \int d^4x \delta c \frac{\delta}{\delta c} W[c] = - \int d^4x c^a \frac{1}{2} f^{abc} c^b \frac{\delta}{\delta c^c} W[c]$$

↑  
 $-\frac{1}{2} [c, c]$

$$\equiv c \cdot X_c W$$

THEN  $\delta_c = \begin{cases} c \cdot X & \text{on } W[A] \\ c \cdot X_c & \text{on } W[c] \end{cases}$

NOTS: SUBSCRIPT C LABELS GHOST IF

FACT:  $[X^a(x), X^b(y)] = f^{abc} X^c(x) \delta(x-y)$

pf. ~~DIS MY ASS~~. [IT'S NOT PARTICULARLY ILLUSTRATING]  
 LOOK IT UP OR DERIVE IT YOURSELF.

- THE GAUGE (BRST) OPERATORS FURNISH AN INFINITE DIMENSIONAL REPRESENTATION OF THE GROUP.

↳ This is as we expect tautologically

ANOTHER WAY TO CAST THE WZ CONSISTENCY CONDITION IS THIS:

$$X^a(x) G^b[A](y) - X^b(y) G^a[A](x) = f^{abc} G^c[A](x) \delta(x-y)$$

HERE WE'VE ONLY USED THE "GAUGE TRANSFORMATION" PART OF THE BRST TRANSFORMATION. WE CAN GO A BIT FURTHER USING THE ENTIRE BRST SYMMETRY + ITS COHOMOLOGY

DEFINE  $G[c, A] = \int d^4x c^a G^a[A]$

↳ PART OF ANOMALOUS WARD IDENTITY  
 $\delta_c W[A] = G[A]$

THE WESS-ZUMINO CONSISTENCY CONDITION IS

$$\delta_c G[c, A] = 0$$

↳ one can check that this is indeed equivalent to the boxed equation above

REMINDER:  $\delta_c$  CARRIES GHOST # = 1  
 MOD OUT BY 'TRIVIAL' SOLUTION  $G[c, A] = \delta f[A]$ ,  
 THESE CAN BE REMOVED BY FINITE COUNTERTERMS

LOCAL FUNCTIONAL

SO THE ANOMALY IS THE COHOMOLOGY  $H^1$  OF  $\delta_c$  @ GHOST NUMBER UNITY. (local functionals of ghost #1 modulo terms like  $\delta(\text{loc func of ghost #0})$ ).

### PART III: SOLVING THE WZ CONSISTENCY CONDITIONS

THERE IS A POWERFUL MATHEMATICAL TOOL FOR SOLVING THE WZ CONDITION. IT ALLOWS YOU TO COMPLETELY DETERMINE ~~Q(C,A)~~  $Q(C,A)$  UP TO OVERALL NORMALIZATION & TURNS OUT TO RELATE SEVERAL PHYSICALLY RELEVANT QUANTITIES. IN FACT, THIS IS WHY THE WZ CONDITIONS ARE SO POWERFUL

→ ONE CAN EVEN USE THE WZ CONSISTENCY CONDITION AS A FORMAL DEFINITION OF THE ANOMALY!

I DON'T WANT TO GET BOGGED DOWN IN MATHEMATICAL MACHINERY, SO WE WILL ONLY GO OVER THE TECHNIQUE VERY HEURISTICALLY. FORTUNATELY, YANG'S PREVIOUS BSM JC TALKS ON CHARACTERISTIC CLASSES INTRODUCES THE TECHNICAL FRAMEWORK ADMIRABLY.

THE TECHNIQUE IS CALLED THE "STRA-ZUMINO DESSENT EQUATIONS"

FIRST LET'S GET A FLAVOR OF WHAT'S GOING ON BEHIND ANY RANCY MATH TO SEE THAT IT IS PLAUSIBLE THAT THE WZ CONDITIONS COULD BE USEFUL.

"EXAMPLE": WHAT IS THE  $Q(C,A)$  FOR THE NON-ABELIAN ANOMALY?

remark: seems silly that this is an 'example' - isn't this the whole point? Turns out there's much more.

A NICE ANSATZ:

$$Q(C,A) = \frac{-1}{24\pi^2} \text{Tr} \left( c \left( (dA)^2 + c_1 dA A^2 + c_2 A(dA)A + c_3 A^2 dA + c_4 A^4 \right) \right)$$

↑ normalization fixed by the triangle diagram

ghost

NOW YOU MIGHT JUSTIFIABLY PROTEST: WHY DID WE NEED TO DO A PERSPECTIVE FEYNMAN DIAGRAM CALCULATION TO DETERMINE THE OVERALL COEFFICIENT? DOESN'T THE TRIANGLE DIAGRAM TELL US EVERYTHING WE NEED TO KNOW ANYWAY?

1. IN PRINCIPLE, WE DON'T CARE ABOUT THE OVERALL COEFFICIENT. WE COULD HAVE IGNORED IT & JUST WORRIED ABOUT RELATIVE COEFFICIENTS OF THE TERMS.
2. NAÏVELY, THERE ARE OTHER DIAGRAMS

eg. CONSIDER  $SU(3)_V \times SU(3)_A$  OF QCD

FINITE, BUT RED FOR VECTOR WARD IDENTITIES DUE TO DIFFERENT SCALAR'S (Bardeen '69)

IT IS A FACT THAT THE ANOMALY IS 1-LOOP EXACT, BUT IN PRINCIPLE THERE ARE OTHER 1-LOOP DIAGRAMS BESIDE THE TRIANGLE.

∴ [do the boxes actually matter?]

3. FURTHER, WE COULD ALSO ADD LOCAL COUNTER TERMS TO  $W(C, A)$  THAT COULD SHIFT THE ANOMALY.

NOW LET'S SEE HOW THIS MIGHT WORK.

$$\delta_c G[A] = 0$$

CONSIDER THE  $c_4$  TERM:

$$\delta_c \text{Tr}[cA^4] \quad \swarrow \quad A \rightarrow A + Dc$$

↓ some work

$$= \text{Tr}[-cA^4c] + \mathcal{O}(A^3, cdc)$$

∴ NO OTHER TERMS IN  $\delta_c G$  THAT CAN CANCEL THIS  $\Rightarrow c_4 = 0$ .

WE CAN KEEP CHUGGING ALONG W/ THE  $c_{1,2,3}$  TERMS. WE DON'T NEED THEM TO CANCEL, WE JUST NEED THEM TO BE TOTAL DERIVATIVES UNDER THE  $D^4x$ .

↳ WE END UP W/  $c_1 = -c_2 = c_3 = 1/2$

WHICH RECOVERS THE USUAL FORM OF THE NON ABELIAN ANOMALY.

# Stora Zumino ↑ DESCENT EQS "CHAIN OF"

ALGEBRAIC MANIFESTATION: STORA, BRST OPERATOR → we'll discuss this

GEOMETRIC MANIFESTATION: ZUMINO → next part (briefly)

TOPOLOGICAL MANIFESTATION: INDEX THM

↳ SEE DEAN'S TALK THIS SEMESTER

PHYSICAL MANIFESTATION: INTER-RELATION OF ALL OF THESE CHERN-THINGS. → SEE YANG'S TALKS

↑ really pulls together a lot of the ideas that we've been developing this semester.

BY NOW YOU SHOULD BE CONVINCED THAT  $\delta_c$  IS A KIND OF (EXTERIOR) DERIVATIVE. ↙ USUALLY CALLED  $\delta$

$\delta_c^2 = 0$      $\Rightarrow$     PHYSICS LIVES IN ITS COHOMOLOGY  
↑ SIMILAR TO  $d$

IN FACT: ONE CAN CHECK THAT  $\{\delta_c, d\} = 0$

POINCARÉ LEMMA:

$$\delta_c \int d^4x c^a G^a[A] = 0 \Rightarrow \boxed{\delta_c (c^a G^a[A]) = -dQ_3^2(c,A)}$$

GHOST #  
↓  
FORM #  
↑

(AT LEAST LOCALLY, WE WON'T DISCUSS THE GENERALIZATION TO NONTRIVIAL GAUGE BUNDLES ~~AND~~ OTHER THAN TO SAY THAT SUCH A GENERALIZATION IS POSSIBLE)

↳ See Bertlmann ch. 9.2

$Q$  IS ONE OF THE CHERN-SIMONS FORMS ↙ see Yang's talk

FOR A SYM INV. POLYNOMIAL  $P(F^n)$ ,  $P(F^n) = dQ_{2n-1}(A,F)$   
↑  
eg  $\text{Tr } F^n$

Q is GENERICALLY CALLED A TRANSGRESSION. FROM YANG'S TALK (SEE ALSO HIS NOTES, NAKAHARA, BERTHMANN) WE KNOW THAT THERE IS AN EXPLICIT FORMULA FOR THE TRANSGRESSION:

$$P(F^n) = dQ_{2n-1} \Rightarrow \boxed{Q_{2n-1}[A, F] = n \int_0^1 dt P[A, tF + (1-t)A^2]}$$

DETAILS ARE NOT IMPORTANT. THE POINT IS:

FACT: GIVEN  $P(F^n)$ ,  $\exists$  EXPLICIT FORMULA FOR  $Q_{2n-1}$

REMARK: THE FUNNY WAY THAT F APPEARS ON THE RHS COMES FROM TOPOLOGICAL INVARIANCE OF AN INVARIANT POLYNOMIAL. GIVEN TWO CONNECTIONS THAT ARE HOMOTOPICALLY RELATED

$\hookrightarrow$  we could write  $A_t = tA + (1-t)\bar{A}$

$$\int P[F^n] - \int P[\bar{F}^n] \Rightarrow P[F^n] - P[\bar{F}^n] = dQ[\bar{A}, A]$$

TO DERIVE THE FORMULA FOR Q, ONE USES THE HOMOTOPIC CONNECTION  $A_t$ . (typically we're interested in the case where  $P[\bar{F}^n] = 0$ .)

NOW SUPPOSE WE HAVE THE INVARIANT POLYNOMIAL  $P(F^n) = \text{Tr } F^n$ .

POINCARÉ LEMMA:  $\text{Tr } F^n = dQ_{2n-1}^0$

~~TO DERIVE THE FORMULA FOR Q, ONE USES THE HOMOTOPIC CONNECTION  $A_t$ .~~

CONSIDER  $\delta_c Q_{2n-1}^0$ :  $d(\delta_c Q_{2n-1}^0) = -\delta_c dQ_{2n-1}^0 = -\delta_c \text{Tr } F^n = 0$

POINCARÉ LEMMA:  $\delta_c Q_{2n-1}^0 = -dQ_{2n-2}^1$   $\leftarrow \exists$  some  $Q_{2n-2}^1$   
GHOST # 1 SINCE  $\delta_c$  HAS GN.

CONSIDER  $\delta_c Q_{2n-2}^1$ :  $d(\delta_c Q_{2n-2}^1) = -\delta_c dQ_{2n-2}^1 = \delta_c^2 Q_{2n-1}^0 = 0$

POINCARÉ LEMMA ...  $\exists$  SO FORTH! UNTIL  $\delta_c Q_0^{2n-1} = 0$

DESCENT EQUATIONS:

$$\begin{aligned} \text{Tr } F^n - dQ_{2n-1}^0 &= 0 \\ \delta_c Q_{2n-1}^0 + dQ_{2n-2}^1 &= 0 \\ \delta_c Q_{2n-2}^1 + dQ_{2n-3}^2 &= 0 \\ &\vdots \\ \delta_c Q_0^{2n-1} &= 0 \end{aligned}$$

eg. For  $n=2$ ,  $P(F^2)$

$$\begin{aligned} Q_3^0 &= \text{Tr} [A dA + \frac{2}{3} A^3] && \leftarrow \text{CHIRAL ANOMALY!} \\ Q_2^1 &= \text{Tr} c dA && \text{NOT A COINCIDENCE} \\ Q_1^2 &= -\text{Tr} c^2 A \\ Q_0^3 &= -\frac{1}{3} \text{Tr} c^3 \end{aligned}$$

[ $n=3$  gives NA ANOMALY @ 1st ORDER IN  $c$ ]

~~THE~~ OBSERVATION:  $\text{Tr} F^n = dQ_{2n-1}^0$

↑  
ABELIAN (CHIRAL) ANOMALY IN  $2n$  DIMENSIONS!

FACT:  $Q_{2n-2}^1$  IS THE NON-ABELIAN ANOMALY IN  $(2n-2)$  DIM!

- SANITY CHECK: WHAT HAPPENED TO WZ CONSISTENCY? WE ORIGINALLY STARTED W/

$$\int_c (c^a G^a[A]) = -\int Q_3^2 [c, A]$$

~~THE~~ THEN WE WROTE SOME 'ARBITRARY'  $P(F^n) = \text{Tr} F^n$  AND WROTE OUT A CHAIN OF TRANSGRESSIONS.

WHAT DO THE  $Q$ 'S OF  $\text{Tr} F^n$  HAVE TO DO WITH THE  $Q_3^2$  APPEARING IN THE WZ FORMULA?

→ JUST INTEGRATE OVER SPACETIME

$$\text{DESCENT EQ: } \int_c Q_{2n-2}^1 + dQ_{2n-3}^2 = 0$$

$$\Rightarrow \int d^4x \int_c Q_{2n-2}^1 = 0$$

SATISFIES WZ CONSISTENCY! ✓

↳ OF COURSE, CAN ADD LOCAL FUNCTIONALS AS COUNTERTERMS (PHYSICS IS IN THE COHOMOLOGY)

VERY INTERESTING RELATION BETWEEN ABELIAN & NON-ABELIAN ANOMALIES IN DIFFERENT DIMENSIONS!

# PART IV: REMARKS (GEOMETRY & OTHER SILLY THINGS)

## DESCENT EQUATIONS

- CAN GENERALIZE TO NONTRIVIAL GAUGE BUNDLES.
- COHOMOLOGY FROM CONSISTENCY CONDITION:  $H(\delta_c)$   
 $\delta_c G(c, A) = 0$  w/  $\delta_c^2 = 0$ ; mod by  $G \sim \delta_c F(A)$
- COHOMOLOGY FROM DESCENT EQN:  $H(\delta/d)$   
 $\delta_c Q^{2n-2} + d Q^{2n-3} = 0$   
 mod by  $Q^{2n-2} \sim s \tilde{Q}^{2n-1} + d \tilde{Q}^{2n-2}$
- GENERAL SOLUTIONS TO THE DESCENT EQS WERE FOUND BY STORA USING THE "RUSSIAN FORMULA"; THIS IS THE WAY IT IS TYPICALLY DONE IN TEXTBOOKS
- CAN ALSO SOLVE THE DESCENT EQS <sup>STARTING</sup> FROM THE BOTTOM  
 SEE: PIGNET & SORELLA ~~THE~~ LNP 128 (1995)

## PHYSICS OF THE CHERN-SIMONS FORMS

WE MET THESE IN YANG'S TALK. NOW WE SEE THAT THEY ARE ALL LINKED VIA THE DESCENT EQS.

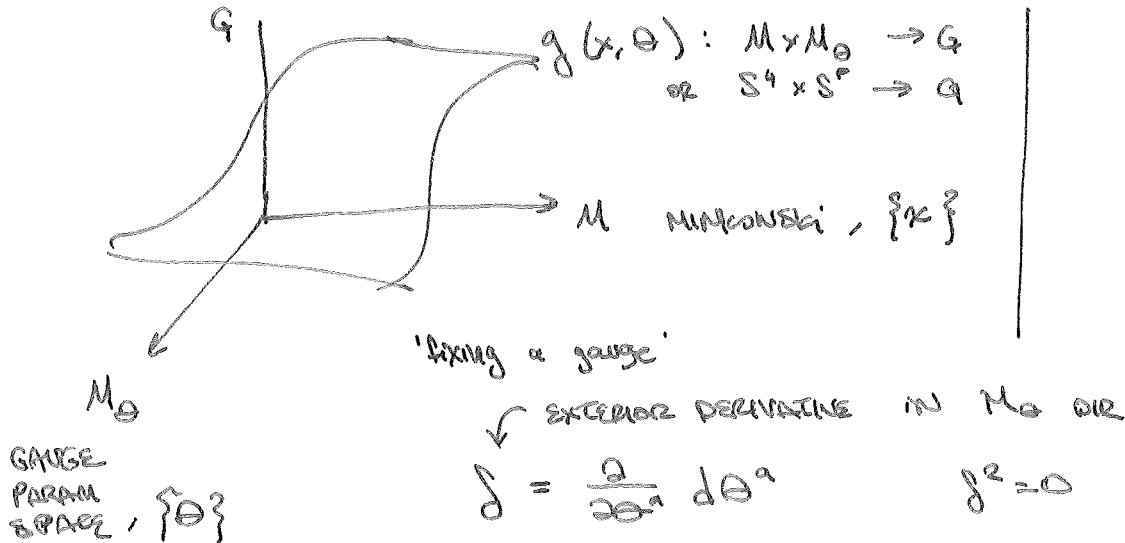

- $Q^{2n-1}_0$ : QUANTUM ACTION OF TOPOLOGICAL (CS) THEORIES  $\int$  <sup>ABELIAN ANOMY</sup> IN  $2n$ -DIM  
 (SEE YONG-HUI'S TALK, SPRING 2010)
- $Q^{2n-2}_1$ : NONABELIAN ANOMALY IN  $(2n-2)$  DIM. (UP TO NORMALIZE)
- $Q^{2n-3}_2$ : SCHWINGER TERM OF EQUAL TIME COMMUTATORS
- $Q^{2n-4}_3$ : IN QM, RELATED TO FAILURE OF JACOBI IDENTITY @ MAB MONOPOLES

↳ higher terms have no known interpretation, but are commonly believed to be physically significant

# ZUMINO'S GEOMETRIC APPROACH

ZUMINO ARRIVED @ THE CONSISTENCY CONDITIONS & DESCENDERS FROM A MORE GEOMETRIC (& ELEGANT) FORMALISM. WE WON'T GO INTO IT EXCEPT TO HIGHLIGHT GEOMETRICAL INTERPRETATIONS FOR ASPECTS OF THE 'ALGEBRAIC' APPROACH THAT WERE SOMEWHAT AD-HOC.

MAIN IDEA: EXTEND SPACETIME MANIFOLD TO INCLUDE THE PARAMETER SPACE OF THE GAUGE GROUP.

NOW JUST "DO DIFFERENTIAL GEOMETRY" ON THIS.

INFINITESIMAL GAUGE TRANSFORMATION GIVEN BY THE  $M_0$  MAURER-CARTAN FORM

↑  
RECALL IN GEOM OF LIE GROUPS THE MC FORM CONVERTS AFFINE TAN VECTORS TO ELEMENTS OF THE LIE ALGEBRA.

$$c = g^{-1} dg = c_a(x, \theta) d\theta^a \leftarrow \text{1 FORM!}$$

↑  
FADEEV-POPOV GHOST, WHICH PLAYED ROLE OF GENERALIZED GAUGE TRANS PARAM IN BRST.

↪ 1-FORM: "EXPLAINS" ANTI-COMMUTING (FERMIONIC) IDENTITY!

EXTERIOR DERIVATIVES WORK AS WE'D EXPECT,

eg VOL FORM = dx^1 \dots dx^4 \wedge d\theta^1 \dots \wedge d\theta^P

EXTERIOR DIFFERENTIAL OPERATOR ON WHOLE SPACE:

\Delta = d + \delta \quad w/ \quad \Delta^2 = 0

\hookrightarrow 'explains' d\delta\_c + \delta\_c d = 0

IE THE FORM ALGEBRA PROVIDES ANISYMMETRIZATION

- BRS ALGEBRA: VERY AD HOC WHEN WE INTRODUCED IT. WE REQ. THAT TRANS OF A IS A GAUGE TRANS, BUT THE OTHER TRANSFORMATIONS WERE ENGINEERED TO MAKE \delta\_c NILPOTENT (\delta\_c^2 = 0).

IN ZOMINO'S PICTURE, THE BRS ALGEBRA ~~IS~~ APPEARS AUTOMATICALLY AS THE MAURER-CARTAN STRUCTURE EQS.

\downarrow FROM THE GEOMETRY OF THE SPACE! (eg FROM HEISEN THEORIES OF GRAVITY)

eg/

COMES FROM dW(x,y) = XW(y) - YW(x) - W(x,y)

FOR A LIE GROUP w/ 1-FORMS \Theta,

d\Theta^a(x\_b, x\_c) = -f^a\_{bc}

BUT: dx^v dx^w(x,y) = x^v x^w - y^v x^w

\Rightarrow \Theta^b \bullet \Theta^c(x\_b, x\_c) = f^b\_c \delta^c - f^c\_b \delta^b

\Rightarrow \boxed{d\Theta^a = -\frac{1}{2} f^a\_{bc} \Theta^b \Theta^c}

\downarrow

\Rightarrow \boxed{\delta V = -V^2 = -\frac{1}{2} [V, V]}
